

2-98 Anemone 1A

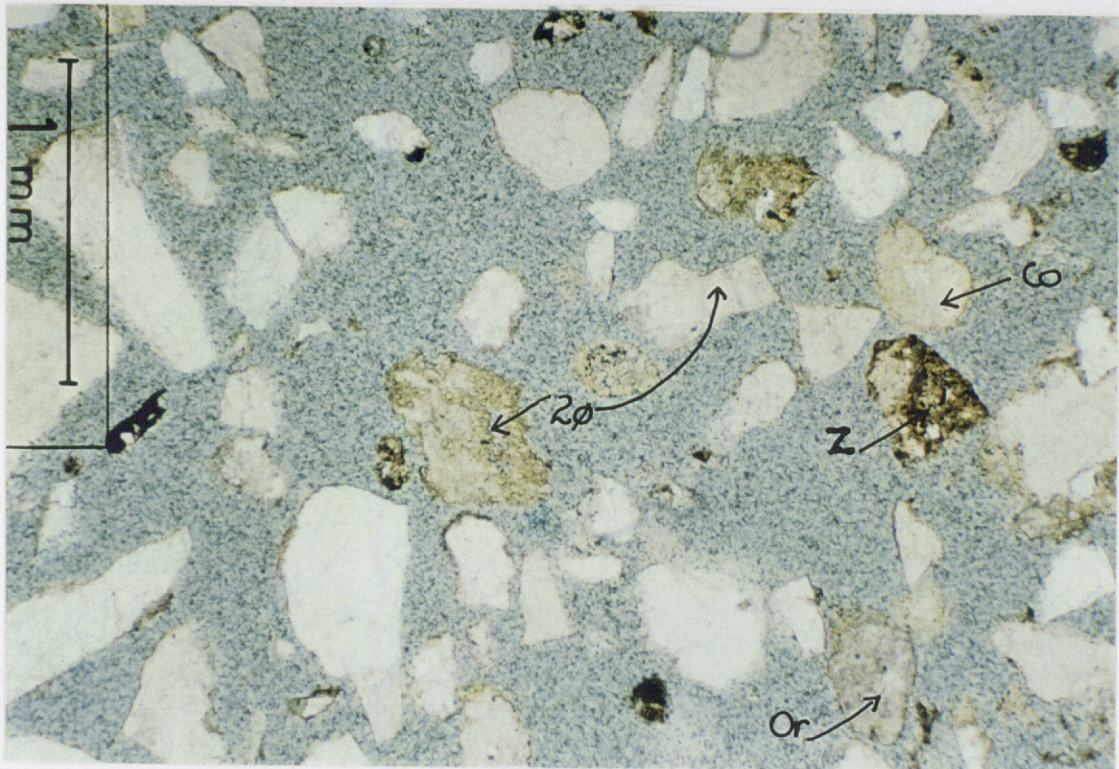

Figure 1, Anemone #1A, cuttings, 4530 - 35m. (plane polarized light). Crushed grains from the washed sample show quartz as clear grains, orthoclase with dusty sericite alteration (Or), a composite grain or very fine sandstone (Co) and an organic rich siltstone (Z). Two grains of microcline show dissolution to form secondary porosity (2ø).
