Rig on Location	-	3 November, 1981
Drilling Unit	-	Petromar "North Sea" (Drillship)

1.7 Well Status on Rig Release

Plugged and Abandoned Gas Discovery

1.8 Drilling Summary

The drillship "Petromar North Sea" departed the West Seahorse No 1 location at 1400 hours, 3rd November 1981, enroute to the Baleen No 1 location. The rig arrived at the proposed location at 2000 hours, 3 November 1981.

The eight anchors were run out into position, the rig pulled over location and the anchor chains tensioned up. The temporary guide base was run indicating water depth of 54.9m. (Rotary table to seabed of 64m.) The 36" hole was spudded at 2045 hours, 4 November, 1981 and was drilled to 71m. A 26" bit was then run and used to drill to 225m. The hole was displaced to high viscosity mud, a wiper trip made to the guide base, and the hole was re-filled with mud.

The 20" casing was then run and landed with the shoe at 209.05m. This casing was fitted with a 20-3/4" wellhead housing integral with a 30" pile joint, 30" wellhead housing and permanent guide base. The casing string was cemented in place, and the 20-3/4" BOP and 22" marine riser were run and latched to the 20-3/4" wellhead. The 20" casing was pressure tested to 500 psi.

A 17½" bottom hole assembly was made up, the 20" casing shoe drilled out and new hole drilled to 228m. A formation leak-off test was run indicating formation strength of 1.73 SG. The 17½" bit was pulled, a 12¼" bit and bottom hole assembly run, and 12¼" hole drilled to 577m without incident. An attempt was made to log but the tools hung up at 406m. The 12¼" bit was run back to bottom, a wiper trip made, and logging re-attempted. The DIT/BHCS/GR, FDC/CNL/GR/CAL and one sidewall core gun completed.

A conditioning trip was made and then 9-5/8" casing run and landed with the shoe at 566.08m. A 13-5/8" wellhead housing was adapted to run with this casing. The 9-5/8" casing was cemented in place and the 20-3/4" BOP and marine riser pulled. After waiting on weather the 13-5/8" BOP stack was run on the 22" marine riser. The BOP was latched to the 13-5/8" wellhead housing, casing was pressure tested to 2500 psi and the BOP fully tested.

An 8½" bit and bottom hole assembly were made up and run into the hole. The casing shoe was drilled out and 3m new hole drilled to 580m. A formation leak-off test was conducted indicating formation strength of 1.98 SG. The 8½" hole was drilled ahead to 663m with occasional stops to circulate up cuttings samples. A small kick was experienced at 663m with indicated surface drill pipe pressure of 450 psi. Kill mud was mixed to 1.54 SG, the well killed, and then mud weight reduced to 1.50 SG due to mud losses to the formation. The 8½" hole was continued to 1030m without further incident. A wiper trip was made prior to electric logging. The DLL/MSFL/GR, FDC/CNL/GR, BHCS/GR, HDT and velocity survey logs were completed. Two runs were made with an RFT tool for pressures and fluid samples, followed by two sidewall core guns.

A cement plug was set in the 8½" open hole to cover the interval 875 - 775m. A 7" casing liner was then run and landed with the shoe at 760m and with the liner hanger at 451.36m. The liner was cemented, the liner packer set and excess slurry reversed out of the hole. The 13-5/8" BOP stack was then pulled, the lower rams changed from 4½" to 3½" pipe rams, the stack re-run and pressure tested.

A 7" casing scraper was run to the top of soft cement at 721m, and KCL polymer mud spotted from 716 - 666m (over the proposed perforating zone). The CBL/VDL/GR log was run indicating top of cement around the 7" casing at 608m. A pressure test indicated the liner lap was leaking; hence, drill pipe was run, a 50 sack cement slurry plug spotted across the liner hanger and then squeezed to the liner lap.

An 8½" bit was used to drill out the cement from 430 - 461m. A 6" bit drilled out cement from 461 - 471m, the casing was then pressure tested to 2200 psi and KCL polymer mud re-spotted at 715m.

The interval 700 - 706m was perforated at 13 shots/m and DST tools picked up from DST No 1. The tools were run on 3½" Hydril tubing and the packer set at 685m. The test consisted of an initial flow period of 8 minutes, initial shut in of 57 minutes, final flow period of 10 hours 15 minutes and final shut in of 1 hour 17 minutes. Flow stabilized at about 1.8 mmscf/d on a 1" choke.

The test tools were pulled and a bridge plug run and set at 690m. The plug was pressure tested to 2200 psig. A 6" bit and casing scraper were run to 680m and KCL/Polymer mud spotted from 680 - 630m.

The interval 662 - 670m was perforated at 13 shots/metres after two gun failures. The DST tools were picked up for DST No 2. After running to bottom the tools were pulled due to a malfunction of the packer. The packer was eventually set at 648m. The test consisted of an initial flow period of 6 minutes, initial shut in of 39 minutes, final flow period of 300 minutes and final shut in period of 205 minutes. Final flow stabilized at about 6.3 mmscf/d on a 1" choke.

A 7" bridge plug was set at 652m and pressure tested to 2000 psig. An initial attempt to set a 17.5 sack cement plug on top of the bridge plug was unsuccessful, and a 30 sack plug was finally set. A surface cement plug of 80 sacks was set to cover the interval 165 - 100m. The BOP stack and riser were then pulled. A mechanical cutter was used to cut the 9-5/8" casing at 74.9m with the 13-5/8" wellhead housing and 9-5/8" casing stub subsequently recovered. The 20" casing was cut at 73.4m and the 20-3/4" wellhead housing with 20" casing stub similarly recovered. The temporary guide base then was pulled.

Anchors were pulled and the drilling vessel departed the Baleen No 1 location at 0600 hours, 30 November 1981.

1.9 Geological Summary (Enclosure 1)

The Baleen No.1 well was drilled to test a structure formed by arching into a major east-west, high angle reverse fault. The structure consists of two culminations separated by a minor saddle. Closure was mapped at two horizons, designated "Top Latrobe" and "Top Strzelecki". Due to standard drilling practice, sampling commenced below the 20 inch casing shoe, set at 209 metres.

The interval 209-653 metres consisted of coarse-grained calcarenites, grading through calcisiltites and calcilutites, calcareous and glauconitic claystones. Based on palaeontological evidence this sequence has been dated from Upper Eocene to Pliocene.

A major lithological change occurred at 653 metres and continued to 707 metres. Three distinct zones within this interval were interpreted from wireline log responses and petrological studies. Two iron oxide/carbonate rich sandstone-siltstone bands were separated by a glauconitic, micaceous sandstone/siltstone/claystone sequence. These zones were interpreted as being Upper Eocene in age.

From 707-1030 metres the well penetrated a monotonous sequence of sandstones, argillaceous in part, siltstones, claystones and minor coals. Log interpretations suggest that this interval may have been weathered from 707 to 850 metres. Lithic fragments occurred throughout this interval. Palynological studies showed the interval to be of Lower Cretaceous age.

Drill Stem Tests proved movable hydrocarbons in two zones. DST No.1 over the interval 700-706 metres flowed 1.8 MMcf/d of dry gas. DST No.2 over the interval 662-670 metres flowed 6.3 MMcf/d of dry gas and formation permeabilities were calculated to be 747 md and 56 md respectively. The well bottomed in sediments of Lower Cretaceous age at a total depth of 1030 metres.

2.0 DRILLING

(Pages 6 - 22)

2.0 DRILLING

2.1 Drilling Operations

2.1.1 Drilling Data Summary

(i)	Drilling Contractor:	Petromarine Drilling (Aust) Pty Ltd Office Suite 1-5 1st Floor, Stratham House 49 Melville Parade SOUTH PERTH WA 6151
(ii)	Drilling Vessel:	'Petromar North Sea' drillship, rated to drill to 4570m with 5" drill pipe, maximum water depth 183m.
(iii)	Power Supply:	- Four Caterpillar D399B T.A. diesel engines, each driving a GE-606 D.C. Generator. - Three Caterpillar 379TA diesel engines, each driving a 350 KW A.C. Generator. - One 100 KW emergency generator driven by one GM 6-71 diesel engine.
(iv)	Derrick:	Pyramid special design 146 ft x 56 ft x 34 ft base, gross nominal capacity of 454 tonnes.
(v)	Blow Out Preventor Equipment:	- 20-3/4" x 2000 psi W.P. Cameron double gate type 'U' with 20-3/4" Hydril 2000 MSP annular. - 13-5/8" x 5000 psi W.P. Cameron Triple gate type 'U' with 13-5/8" Hydril 5000 psi W.P. type 'GL' annular.
(vi)	Mud Pumps:	Two National 12-P-160 Triplex single acting pumps each driven by two GE 752 HP electric motors.

2.1.1 Drilling Data Summary (Continued)

(vii) Drawworks: National Type 1625 DE powered by two GE 752 Traction motors with a 60" RC Parkersburg Hydromatic brake with over-running clutch, grooved drum to handle 1½" - 6 x 19 IWRC drilling line.

(viii) Rotary Table: National C-375 - 37½" independently driven by one GE 752 electric motor complete with master bushing and pin type kelly drive bushing.

(ix) Heave Compensator: One Western Gear single cylinder Heave Compensator with minimum 20 ft stroke and minimum capacity of 400,000 lbs in working mode and 1,000,000 lbs in latched mode.

2.1.2 General Well Data

(i) Location:

Latitude 38 deg 00 min. 36.630 sec South
Longitude 148 deg 26 min. 08.400 sec East
UTM Coordinates -
Northing 5792068 metres
Easting 626032 metres
(CM 147 deg)

The final location is 23 metres at a bearing of 207.7 deg from the proposed location.

(ii) Datum: Unless otherwise stated all depths are relative to Rotary Table, which for this rig is 9.45m above Mean Sea Level. Water Depth at the location was measured as 54.89m at Mean Springs Low Water.

That is: RT - MSL = 9.45m
RT - Seabed = 64.34m
Water Depth = 54.89m

2.1.2 General Well Data (Continued)

(iii) Dates

Commenced move to location -
1400 hours, 3 November 1981.

Arrived at location -
2000 hours, 3 November 1981.

Spudded -
2045 hours, 4 November 1981.

Reached Total Depth -
1500 hours, 16 November 1981.

Last Anchor bolstered, and
ready to move off -
0600 hours, 30 November 1981.

Drilling Time, Spud to Total Depth -
11 days, 18.25 hours.

(iv) Hole Size and Casing Details:

- Hole:	Size	36"	26"	17½"	12¼"	8½"
	Depth (m)	71	225	228	577	1030
- Casing:	Size	30"	20"	-	9-5/8"	7"
	Depth (m)	68	209	-	566	760
	API Grade	5L/'B'	5LX/X-52	-	5AC/K55	5AC/N80
	Weight	305	94	-	40	29

2.2 Daily Operations Record

2.2.1 Daily Drilling Operations Summary

See attached Figure 2.

Hudbay Oil (Australia) Ltd.

Subsidiary of Hudson's Bay Oil and Gas Company Limited

DAILY DRILLING OPERATIONS SUMMARY

WELL BALEEN NO 1

DATE	DEPTH	OPERATION
4/11/81	-	Rig departed West Seahorse No 1 location at 1400 hours, 3 November 1981, en route to Baleen No 1 location. Arrived at location at 2000 hours, 3 November 1981. Ran six anchors.
5/11/81	86m	Ran remaining two anchors, soaked anchors for 5½ hours, pulled rig over location and tensioned up. (Final ships heading 205 deg Mag.) Ran temporary guide base, (water depth 54.89m). Spudded with 36" bit at 2045 hours, 4 November 1981. Drilled 36" hole 64 - 71m, spotted 30 bbl Hi-vis mud on bottom. Ran 26" bit, drilled 71 - 86m.
6/11/81	225m	Drilled 26" hole 86 - 225m. Displaced hole with 550 bbls mud. Surveyed. Pulled out to guide base, ran in to 225m - no fill. Pumped 380 bbls mud and pulled out. Positioned permanent guide base in moonpool. Commenced running 20" casing.
7/11/81	225m	Completed running 20" casing, landed same with shoe at 209.05m. Displaced casing to seawater, cemented casing (details per Cementing Report). Rigged up and ran 20-3/4" BOP stack and 22" marine riser. Latched BOP to wellhead, pressure tested casing and blind rams to 500 psig, rams to 1000 psig, manifold to 2000 psig. Made up 17½" bottom hole assembly, commenced drilling out cement and shoe.
8/11/81	390	Completed drilling out cement and shoe. Drilled new hole 225 - 228m. Ran leak-off test - formation strength 1.73 SG. Changed from 17½" bit to 12¼" bit. Drilled 228 - 249m. Surveyed - misrun. Drilled 249 - 267m. Surveyed. Drilled 267 - 390m. String parted at saver sub - fished string, laid out drill pipe and collars for inspection. Drilled 390 - 428m.
9/11/81	577m	Drilled 390 - 428m. Surveyed. Drilled 428 - 577m. Pulled out to log. Made one run with DIT/BHCS/GR, unable to pass 406m. Run in hole with 12¼" bit to TD, no fill, worked pipe 245 - 264m. Made wiper trip to shoe, RIH, 3m fill. POOH. Logged DIT/BHCS/BR to 572m. FDC/CNL/GR/CAL.
10/11/81	577m	Completed logging FDC/CNL/GR/CAL. Took one SWC gun. Made up 9-5/8" casing hanger and running tool. RIH with 12¼" bottom hole assembly, washed 554 - 577m. Reamed and washed 544 - 577m. Conditioned mud and hole. Pulled out to run casing. Ran 9-5/8" casing to land casing with shoe at 566.08m.
11/11/81	577m	Circulated casing volume. Cemented 9-5/8" casing (see cementing report for details). Retrieved landing string. Pulled 22" marine riser and 20-3/4" BOP stack, racked back BOP stack. Moved 13-5/8" BOP to moonpool and secured rig due to deteriorating weather conditions.
12/11/81	577m	Waiting on weather.
13/11/81	577m	Waited on weather. Ran 13-5/8" BOP and 22" marine riser. Ran test plug, tested casing to 2500 psi, tested BOP stack. Pulled test plug and ran wear bushing. Made up 8½" bit, picked up 6½" drill collars, RIH and tagged top of cement at 522m.
14/11/81	663m	Drilled out cement, float collar and shoe, clean to bottom, drilled 577 - 580m. Completed leak off test indicating formation strength of 1.98 SG. Drilled 8½" hole 580 - 596m, circulated up sample. Drilled 596 - 625m, circulated up sample. Drilled 625 - 644m, circulated up sample. Drilled 644 - 653m, circulated up sample. Drilled 653 - 663m - pit gain - shut in well. Measured shut in drill pipe pressure 450 psi, mixed kill mud to 1.54 SG. Killed well with 1.54 SG mud, displaced riser to heavy mud. Opened pipe rams on BOP - losing mud. Reduced mud weight to 1.50 SG.
15/11/81	826m	Drilled 663 - 753m. Surveyed. Changed bits, picked up two 8½" stabilizers and RIH. Reamed 683 - 704m. Washed 704 - 753m. Drilled 753 - 826m.
16/11/81	956m	Drilled 826 - 938m. Pulled out to change bits - tight hole 735 - 690m (11.3 tonne overpull). Changed bits, RIH to 927m, washed 927 - 938m - no fill. Drilled 938 - 956m.
17/11/81	1030m	Drilled 956 - 1030m. Made wiper trip to shoe. Circulated and conditioned hole and mud. Rigged up Schlumberger (Line jumped sleave - damaged bridle line - repaired same). Logged DLL/MSFL/GR, commenced FDC/CNL/GR.
18/11/81	1030m	Completed FDC/CNL/CNL/GR log, logged BHCS/GR, and HDT. Ran velocity survey (- after repairing survey tools). Made two runs into hole with RFT tool for pressure and fluid samples. Picked up CST gun.

DAILY DRILLING OPERATIONS SUMMARY

WELL BALEEN NO 1 (Continued)

DATE	DEPTH	OPERATION
19/11/81	775m (PBTD)	Ran CST gun No 1 - 4 bullets lost. Ran CST run No 2 - full recovery. Ran into hole with 8½" bit to TD - no fill. Circulated and conditioned mud. Ran into hole with open ended drill pipe to 875m. Set cement plug 875 - 775m with 123 sacks cement (see abandonment report). Pulled up 4 stands, reversed out drill pipe. Pulled out of hole. Worked on drilling compensator.
20/11/81	735m (Landing Collar)	Completed work on drilling compensator. Made up 7" shoe, collar, hanger, packer, seal assembly, cement plug and liner hanger running tool. Ran 25 joints of 7" casing to set with shoe at 760m, liner hanger at 451.36m. Circulated volume of liner and running string with mud. Set hanger, backed out running tool. Cemented liner with 193 sacks Class 'G' cement (see cementing report). Set liner packer. Pulled back one single, reversed out drill pipe contents - slight cement contamination thoughout entire reverse circulation. Pulled out of hole laying down drill pipe and 6½" drill collars. Retrieved wear bushing. Nippled down and pulled 13-5/8" BOP stack.
21/11/81	735m	Continued pulling BOP stack, landed on dolly. Changed out upper pipe rams to 3½" rams, tested pipe rams to 5000 psig, lower annular to 2500 psig, upper annular to 1500 psig. Repaired high pressure manifold on blue control pod, function tested BOP on both pods. Changed AX ring. Ran BOP stack, landed on wellhead. Ran test plug on 5" DP, pressure tested lower pipe rams to 2500 psig, lower annular to 2000 psig, upper annular to 1500 psig. Ran 3½" DP and test plug, tested upper pipe rams to 2500 psig. Ran 13-5/8" wear bushing. Ran 6" bit and casing scraper, picked up 4-3/4" drill collars and 3½" hydril tubing.
22/11/81	721m	Ran 7" casing scraper to 721m. Circulated and conditioned mud. Worked scraper 682 - 693m. Spotted 6 bbls polymer mud from 716 - 666m. Made trip to wellhead with fluted hanger to check space-out for subsea test tree. Ran CBL-VDL-GR over 7" casing liner. Attempted pressure test of casing - no test. Established injection rate to formation - 1100 psig at 0.25 bbl/min. Picked up 6 joints 3½" drill pipe, ran in on 5" drill pipe to 466m, spotted 50 sacks Class 'G' plus 2% calcium chloride from 466 - 429m. Pulled 2 stands, reversed out drill pipe, hung off on lower pipe rams, squeezed cement to liner overlap. POOH.
23/11/81	721m	Made up 8½" bit and bottom hole assembly, tagged cement at 430m. Drilled out cement 430 - 461m (top of liner). POOH. Ran 6" bit, RIH to 461m, drilled out cement 461 - 471m. Pressure tested casing to 2200 psig. Ran in hole to 715m, spotted 6 bbls polymer mud from 715 - 665m. POOH. Rigged up Schlumberger and perforated 700 - 706 m at 13 s/m at 90 deg phasing. Made up DST tools and started in with 3½" - PH6 tubing.
24/11/81	721m	Completed running into hole with DST string. Rigged up surface equipment, pressure tested surface lines. Set packer at 685m, landed test string. Latched SPRO tool. Opened tools for DST No 1, initial flow period of 8 minutes. Closed in tools for 57 minutes, opened tools for second flow period of 10 hours 15 minutes, Shut in for 1 hour 17 minutes. Pulled SPRO tool.
25/11/81	721m	Unseated packer, circulated annulus free of gas, pulled test string. Rigged up Schlumberger, ran and set bridge plug at 690m after third run in hole. (top slips lost and setting tool misfire). Pressure tested bridge plug to 2200 psig. Ran 6" bit and 7" casing scraper to 680m, spotted KCL polymer mud 680 - 630m. Rigged up Schlumberger, perforated 667 - 670m. Rigged up Schlumberger, perforated 667 - 670m (second gun failed). Reloaded perforating gun, perforated 664 - 667m (third piggy-back gun failed).
26/11/81	721m	Repaired perforating gun, perforated 662 - 670m with 13 s/m. Made up DST string and ran into hole externally pressure testing connections to 9000 psig. Made up and pressure tested surface equipment. Attempted to set packer multiple times - no success. Rigged down surface equipment and pulled test string. Repaired packer. Changed pressure charts and rewound clocks. Ran in with test string externally pressure testing connections.
27/11/81	721m	Rigged up and pressure tested surface equipment. Set packer at 648m, latched SPRO tool. Opened well for initial flow of 7 minutes, closed in for 38 minutes, opened for second flow of 300 minutes, closed in for 140 minutes. Unseated packer, reverse circulated well free of gas. Pulled out test string.
28/11/81	721m	Laid out 3½" tubing and 3½" drill pipe. Rigged up Schlumberger and set 7" bridge plug at 652m. Pressure tested plug to 2000 psi. Ran in with 3½"/5" drill pipe to 652m, spotted 17.5 sacks cement plug (average slurry 1.87 SG). Pulled up to 600m, reverse circulated unbalanced cement plug out of drill pipe. Ran into 651m, spotted 30 sacks cement plug (average slurry 1.87 SG). Pulled out to 165m, circulated hole to seawater. Spotted 80 sacks cement plug (average

DAILY DRILLING OPERATIONS SUMMARY

WELL BALEEN NO 1 (Continued)

DATE	DEPTH	OPERATION
28/11/81 (Continued)		slurry 1.87 SG). Pulled up to 100m, reverse circulated. POOH. Rigged down diverter, unlatched BOP, nippled down slip joint.
29/11/81	-	Pulled 13-5/8" BOP stack, stowed same. Removed rig floor. WOW to offload cutting tools from workboat. Made up casing cutting tools, RIH, cut 9-5/8" casing at 74.92m. Made up 13-5/8" running tool, RIH attempted to screw into wellhead, running string started to back off. POOH, re-torqued tool joints, RIH. Stabbed wellhead, screwed into 13-5/8" housing and pulled same. Ran casing cutters, stabbed in after second attempt, cut 20" casing at 73.42m. Pulled cutting tools. Made up 20" running tool, RIH.
30/11/81	-	Screwed into 20-3/4" housing, pulled wellhead housing and permanent guide base, stowed same. Made up 'J' tool, RIH. Retrieved temporary guide base and hung same in moonpool. Pulled anchors.
		NOTE:
		Underway from Baleen location to Whale No 1 location at 0600 hours, 30 November 1981.

2.2.2 Bottom Hole Assembly Record

36"/26" Hole: 64 - 225m

- Bit, bit sub, 15 x 8" DC's, Cross Over
  Total Length = 54.91m

17½" Hole: 225 - 228m

- Bit, bit sub, 15 x 8" DC's, Cross Over
  Total Length = 134.18m

12¼" Hole: 228 - 577m

- Bit, bit sub, 15 x 8" DC's, Cross Over, 11 joints HWDP
  Total Length = 236.15m

8½" Hole: 577 - 758m

- Bit, bit sub, 12 x 6½" DC's, Cross Over, 1 joint HWDP, Jars, 11 joints HWDP
  Total Length = 226.30m

753 - 1030m

- Bit, bit sub, 2 x 6½" DC's, Stab, 1 x 6½" DC's, Stab, 9 x 6½" DC's, Cross Over, 1 joint HWDP, Jars, 11 joints HWDP
  Total Length = 229.00m

DETAILED CASING AND CEMENTING REPORT

Casing landed on TGB and volume of string circulated prior to cementing with;

Fill of: 1036 sks of Class 'G' cement + 0.5% Thix set 'A' plus 0.25% Thix set 'B'
(700 lbs and 350 lbs respectively.)
Mixed with 247 bbls of drill water at average density of 1.53 S.G.

Tail of: 300 sks of Class 'G' cement
Mixed with 36 bbls of drill water at density of 1.89 S.G.

Cement was displaced to 9m above the shoe using HOWCO unit pumping 160 bbls. final displacement pressure 350 psi. During displacement returns were lost, so pumping was stopped on three occasions of 15 minutes each, so as to allow Thix Set mix to set up. Pressure was gradually increasing as final displacement was reached, indicating that the loss zone could have been plugged.
Float Shoe held.

Operators Representative J B McElhinney

DETAILED CASING AND CEMENTING REPORT

Casing landed with shoe at 566.08m, casing and landing string volume was circulated with mud. Pumped 15 bbl Halliburton CS-2 spacer. Rectify problems with water in fuel and centrifugal pump motor.

Mixed and pumped 360 sks Class 'A' cement slurry mixed with 93 bbls fresh mix water containing 2.5% prehydrated bentonite and 0.75% CFR-2, average slurry density 12.8 ppg, pumping pressure steady at 200 psi.

Followed with 300 sks Class 'A' tail slurry mixed with 36 bbls seawater and 0.1% HRL, average slurry density 15.8 ppg, pump pressure steady at 200 psi.

Released drill pipe dart, no indication that dart dropped from cementing head, opened cement head to release, pumped 3.6 bbls seawater, dart seated on top plug and sheared out at 3500 psi. Pumped casing volume of mud plus 70% of shoe joint - no bump. Displacement pump pressures increased gradually from 275 psi to 725 psi. Bled off line at pump with ½ bbl mud return - floats holding. Backed out running tool. Full mud returns throughout job.

Commenced pumping spacer fluid at 0808 hours, blended gel slurry at 0820 hours, neat cement slurry at 0913 hours and displacement mud at 0948 hours. Displacement completed at 1030 hours.

DETAILED CASING AND CEMENTING REPORT

RIH with 7" liner on Drill Pipe to shoe setting depth of 760m (Top of Liner at 451.36m).
Circulated volume of Liner and Drill Pipe.
Dropped ball and set liner slips. Unlatched running tool and circulated to ensure packer not set.
Cemented liner: 5 bbls drill water ahead, mixed and pumped 193 sks cement 'G' + 0.75% CFR-2 + 19 Halad 22A at 1.94 S.G. with 20 bbls mix water.
Dropped dart and launched wiper plug after pumping 24 bbls mud. Pumped a further 35 bbls, did not bump plug. Shut down to avoid pumping cement out of liner.
(Calculated displacement 57 bbls total.)
Bled off pressure - no flow back.
Set liner Hanger packer with 30,000 lbs weight.

Operators Representative J B McElhinney

Figure 11

2.4 Mud System

2.4.1 Mud Report Summary

36" Hole to 71m, 26" Hole to 225m:

The 36" hole was drilled with a 36" hole opener and 26" bit to 71m, 30 bbls of spud mud was spotted on bottom. The hole opener was removed and 26" hole was then drilled to 225 metres.

Seawater was used to drill the hole, flushing with 15 bbls to 30 bbls spud mud each connection. At casing point 550 bbls of flocculated spud mud was displaced into the hole and the bit pulled to the Temporary Guide Base. After resting the hole for a brief period the bit was run back to bottom and although there was no fill a further 350 bbls of spud mud displaced. The 20" casing was run and cemented, returns being intermittent during cementing.

Leaky valves gave problems on two occasions, the first with a loss of 25 bbls of spud mud and on the second occasion the valve on the overboard line leaked and 260 bbls seawater diluted the spud mud. The valve on the overboard line was replaced.

Further problems with leaking valves persisted thoughout this well.

12¼" Hole to 577m:

After running and testing the BOP stack satisfactorily, the cement was drilled out using seawater. A 17½" bit was used to drill 3m to 225m prior to displacing to mud. A leak off test showed an equivalent to 1.72 SG formation strength. The hole was drilled ahead with a 12¼" bit to 390m where the drill string twisted off at the kelly saver sub. This was fished successfully and the drill pipe and collars laid out and new drill collars and drill pipe picked up. The mud had been made up of salvage mud from the previous interval with added prehydrated gel which gave a funnel viscosity range

2.4.1 Mud Report Summary

12¼" Hole to 577m: (Continued)

throughout of 39 to 44 seconds, a PV range of 5 to 10 cps and a yield point range of 8 to 11 lbs/100 sq ft. As the remainder of the hole to 577m was drilled, Dextrid 0.5 lb/bbl, Q-Broxin 1.6 lb/bbl and minor amounts of Mon Pac were used to reduce the filtrate down to 12 cc and control rheology. The desander and desilter were run continuously whilst drilling to control the mud weight. At casing point, Schlumberger logs were run, the hole was tight at 250m and the logs would not go below 406m. A wiper trip was then made which showed no drag, and logs were successfully re-run after conditioning the hole and mud. A further wiper trip was required with reaming from 554m to 577m before the 9-5/8" casing was run and cemented without problems.

8½" Hole to 1030m:

While waiting on weather the mud in the active tanks was contaminated by approximately 100 bbls seawater increase; this mud was conditioned on drilling out.

After drilling the cement, the mud was treated with Sodium Bicarbonate and a leak off test performed at 580m, equivalent to 1.98 SG. The mud was further treated with Q-Mix and Mon Pac to raise the viscosity slightly, and Dextrid and Q-Broxin added to reduce filter cake and fluid loss.
A gas kick was taken at 663m with the mud weight at 1.04 SG and with only a 10 bbl increase in pit volume. It was caught by the increased flow rate across the shakers.
Shut in drill pipe pressure was 450 psi and shut in casing pressure 480 psi. Whilst weighting mud up to 1.54 SG, the kick was circulated out to avoid exceeding fracture gradient at the shoe, as casing pressure was building up. However, on displacing to 1.54 SG this was found to exceed the fracture gradient and 107 bbls of mud was lost before mud weight could be reduced to 1.47, then to 1.44 SG.

2.4.1 Mud Report Summary

8½" Hole to 1030m: (Continued)

It can be calculated from later flow testing that some of the gas had entered the drill string at the initial kick. However, the mud weight was maintained at 1.44 SG for the remainder of the hole including testing as this gave an overbalance at 633m of 310 psi static, and 190 psi overbalance in the event of riser disconnect.

On the bit trip at 938m the hole gave 25000 lbs overpull at 690 - 735m. The mud was treated with Q-Broxin 0.95 lb/bbl and Dextrid 0.66 lb/bbl, and the tight spot reamed on the trip in with bit no. 7. At Total Depth a wiper trip was made, seawater (50 bbls) leaked in to the active system, the mud conditioned, and Schlumberger logs run.

On successfully completing the suite of logs, the hole was plugged back to 775m and the 7" liner was then run to 760m and cemented.

Testing:

After displacing the riser and changing the rams on the BOP's to 3½", the 7" casing scraper was run and the mud conditioned to 1.44 SG. Some 240 bbls of mud was accidentally pumped over by the rig personnel, then the packing gland on the mixing pump leaked another 75 bbls into the active system. The mud was conditioned and 6 bbls solids free KCl polymer mud made from (after pilot testing) 55 lb/bbls salt (27 lb/bbl KCl) 0.5 lb/bbl Dextrid, and 0.3 lb/bbl X-C Polymer. However, at this point a CBL log showed no cement at the overlap and a pressure test confirmed this. The overlap was squeezed and later 70 bbls mud was lost due to a leaking gate valve when testing burners by pumping water through them.

2.4.1 Mud Report Summary (Continued)

Testing:

After cleaning out the cement and conditioning mud a further KCl Polymer plug was spotted 715 - 665m and Schlumberger perforated the interval 700 - 706m. The packer was run and the first zone tested.

After circulating the hole free of gas at the conclusion of the test, a bridge plug was set at 685m and a further casing scraper run. A further KCl Polymer slug, 6 bbls, was set on bottom and the zone 662 - 670m perforated. After two attempts to set the packer the second zone was tested. On finishing testing and the hole circulated clean of gas, a bridge plug was set at 652m and tested to 2,000 psi. A cement plug was set at 652m, the first was not balanced and flowed out, and was reset with no problems, after conditioning mud which had been water contaminated during the setting of the first plug. The pipe was pulled to 165m, the mud displaced to seawater and the second cement plug set.

About 300 bbls mud was salvaged (sand traps, desander, degasser and slug tank were dumped due to water contamination) and stored as kill mud for the next well Whale No. 1.

2.4.2 Mud Engineering

All mud and chemcials used in the mud system on Baleen No 1 were supplied by Baroid (Australia) Ltd.

Engineers involved in the programme were:

Evan Hill
Alan Searle
Dave Parry

2.4.4 Materials Consumption and Costs

Mud and mud chemicals consumption on this well were as follows:

Material	Unit	Quantity	Cost
Bentonite	100 lb	651	10,090.50
Barite	100 lb	4367	37,992.90
Dextrid	50 lb	88	4,540.80
Monpac	25 kg	12	1,458.00
Q-Broxin/FCL	25 kg	73	1,762.95
Cellogen	25 kg	6	729.00
Caustic Soda	23 kg	42	745.50
Lime	25 kg	6	40.50
Soda Ash	40 kg	15	217.50
Soda Bicarb	40 kg	20	429.80
Coat 888	50 lb	5	116.00
		Total Cost =	$58,122.95

The above costs include 200 sacks of barites used in the temporary guide base and 22 sacks bentonite used for cementing.

2.4.5 Mud Equipment Description

Mud Pumps:

Two National 12-P-160 triplex single acting, each equipped with independently driven centrifugal pumps, each powered by two GE 752 electric motors.

Mud Mixing Pumps:

Ingersoll Rand MIR 150 with 75 HP electric motors, 2 each on active tank and 2 each on reserve tanks.

Shale Shaker:

Brandt Dual Tandem separator.

Desander:

Demco 6 cone x 6" rated at 1050 GPM with a 6" x 8" Mission Centrifugal pump powered by 75 HP electric motor.

2.4.5 Mud Equipment Description (Continued)

Desilter:

Demco 12 cone x 4", rated at 1080 GPM, with Ingersoll Rand centrifugal pump powered by a 75 HP electric motor.

Adjustable Choke:

Swaco Super adjustable choke, 10,000 psi WP, complete wtih control panel.

Trip Tank:

25 bbl capacity, with high low level switch actuated motor for transfer pump.

Active Tank:

One 552 bbl capacity tank.

Reserve Tanks:

Four tanks, total 2608 bbls capacity.

2.5 Flow Testing

2.5.1 Flow Testing Summary

Two drill stem tests were run on this well.

The first drill stem test was run over the interval 700 - 706m RT. The interval was perforated with a 4 inch casing gun at 4 shots per foot with a 90 degree phasing.

Three downhole gauges were used to record pressures and temperatures during the test and a Surface Pressure Read Out (SPRO) Unit was used to provide a continuous surface monitor of the downhole conditions.

An initial 7 minute flow period on a ½ inch choke was followed by a 63 minute initial shut in period. Gas was observed at surface 4 minutes into the initial flow period and the final bottomhole flowing pressure was 413 psig. The final shut in bottomhole pressure at the end of the initial shut in period was 1079.9 psig. The final flow period lasted for 616 minutes. 135 minutes into the final flow period, the choke size was increased from ½ inch to 1 inch. The gas flow rate stabilized at 1.84 MMcf/D at a bottomhole flowing pressure of 177 psig. The well was shut in and after one minute the pressure was 1077.2 psig. The final shut in pressure was 1079.4 psig after 76 minutes.

The second drill stem test was run over the interval 662 - 670m RT. The interval was perforated with a 4 inch casing gun at 4 shots per foot with a 90 degree phasing.

Three downhole gauges were used to record pressures and temperatures during the test and a Surface Pressure Read Out (SPRO) unit was used to provide a continuous monitor of the downhole conditions.

An initial 7 minute flow period was followed by a 38 minute initial shut in. The final flowing period lasted 300 minutes and was followed by a final shut in of 140 minutes. During the final flow period, the well flowed gas on a ½ inch choke at 3.5 - 4.0 MMcf/D at a bottomhole pressure of 817 psig and at rates of 5.8 to 6.3 MMcf/D on a 1 inch choke at 670 psig. The final measured shut in pressure was 1068.3 psig.

2.5.2 Flow Data

The flow data as reported by Flopetrol is attached as Appendix A1 to this report.

2.5.3 Pressure Data

The pressure data as reported by Dowell Schlumberger is attached as Appendix A2 to this report.

2.5.4 Interpretation and Analysis

DST No 1 - Interval 700-706m RT

- Flowed 1.8 MMcf/D of dry gas on a 1 inch choke at a wellhead pressure of 80 psig and a flowing bottomhole pressure of 176 psig.
- Has a formation pressure of 1080 psig as measured by the SPRO gauge at 671m RT.
- Has excellent formation permeability of 747 md.
- Has severe formation damage near the wellbore as indicated by the calculated skin of +1235.
- Did not indicate any reservoir depletion during the test.

DST No 2 - Interval 662-670m RT

- Flowed 6.3 MMcf/D of dry gas on a 1 inch choke at a wellhead pressure of 263 psig and a flowing bottomhole pressure of 670 psig.
- Has a formation pressure of 1075 psig as measured by the SPRO gauge at 631m RT.
- Has a formation permeability of 56 md.
- Has relatively severe formation damage near the wellbore as indicated by a skin factor of +18.5.

DST No 2 - Interval 662-670m RT (Continued)

- Did not indicate any reservoir depletion during the test.

From the DST analysis, the two zones appear to be in pressure communication.

2.6 General Data

2.6.1 Positioning Report

(See Positioning Report per Figure 13, and Appendix A3.)

2.6.2 Downhole Surveys

A Totco 0-8 deg. Inclinometer was used for all downhole surveys in this well:

Depth (m)	Deviation (deg)	Depth (m)	Deviation (deg)
225	Misrun	1030	1/2
267	1		
577	0		
753	1		

2.6.3 Plug Back and Squeeze Cementation Record

(i) Prior to running the 7" liner, the 8½" open hole was plugged back by spotting a cement plug at 875m. This plug consisted of 123 sacks of Class 'G' cement slurry at average 15.8 ppg slurry weight without additives. The plug was sized to cover the interval 875 - 775m. The plug was not tagged.

(ii) A CBL log was run over the length of 7" casing liner and indicated the top of cement at approximately 608m. Pressure testing of the 7" casing liner then indicated a leak was present - this was correctly interpreted as a liner overlap leak. An injection rate of ¼ bbl/min was established past the packer. Drill pipe was run in to 966m and 50 sacks of Class 'G' cement slurry with 2 percent $CaCl_2$ was spotted with slurry weight of 15.8 ppg. A total of 2½ bbls slurry was squeezed away at up to 2200 psi pressure. After drilling out the cement inside the casing, another pressure test to 2200 psi confirmed a good seal.

Proposed Location: 038 deg 00 min 36.01 sec South **Latitude:**

148 deg 26 min 08.74 sec East **Longitude:**

Actual Location: 038 deg 00 min 36.630 sec South **Latitude:**

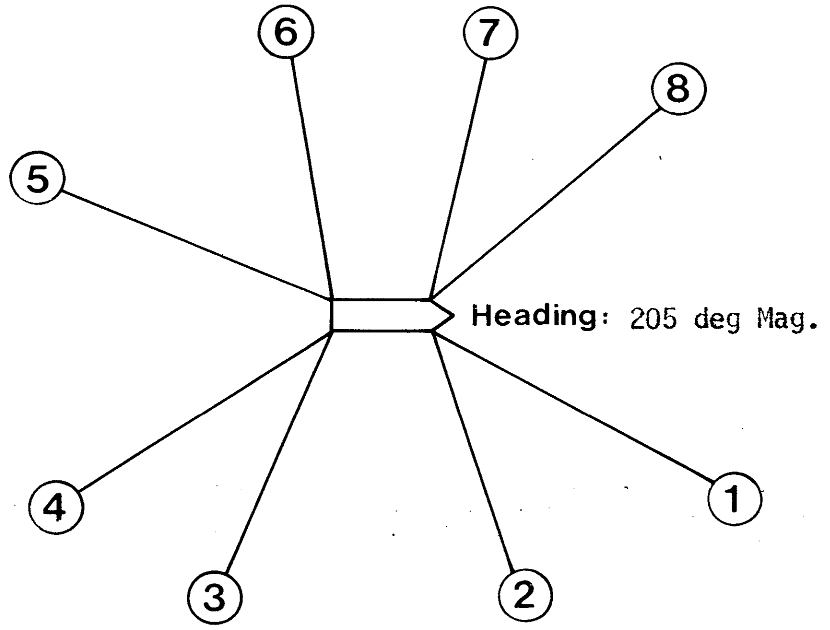
148 deg 26 min 08.400 sec East **Longitude:**

Distance and Bearing from Actual to Proposed: Actual location was 23 metres at 207.7 deg. True from the proposed location.

Survey Method: Trisponder survey, position confirmed by JMR-4 satellite receiver.

Checked By: Racal-Decca Survey Ltd

Anchor Pattern: 30 deg/60 deg pattern from bow and stern



Remarks Commenced running anchors at 2230 hours 3 November 1981, completed 5½ hours soaking, relaying of No. 4 and 5 anchors and final tensioning at 1700 hours 4 November 1981. (18½ hours.) All anchors run out to 1800 - 2000 ft radius. Occasional re-tensioning was required during the programme to maintain position over the wellhead.

POSITIONING
BALEEN - 1

Date June 1982

Drawing Nº A4-DR-531

Figure 13

2.6.4 Fishing Operations

The only fishing operation on this well occurred when the kelly saver sub parted. An overshot was made up and the string retrieved in 2 hours. The drill collars were laid down for inspection.

2.6.5 Side Tracked Hole

No side tracked hole occurred on this well.

2.6.6 Formation Leak Off Tests

(i) 20" casing set at 209m:

Open hole = 209 - 225m
New hole = 225 - 228m
Fluid in hole = Seawater (8.45 ppg)
Indicated Formation Strength = 14.4 ppg equivalent

(ii) 9-5/8" casing set at 566m:

Open hole = 566 - 577m
New hole = 577 - 580m
Fluid in Hole = Mud (8.7 ppg)
Indicated Formation Strength = 16.5 ppg equivalent

(iii) 7" casing set at 760m:

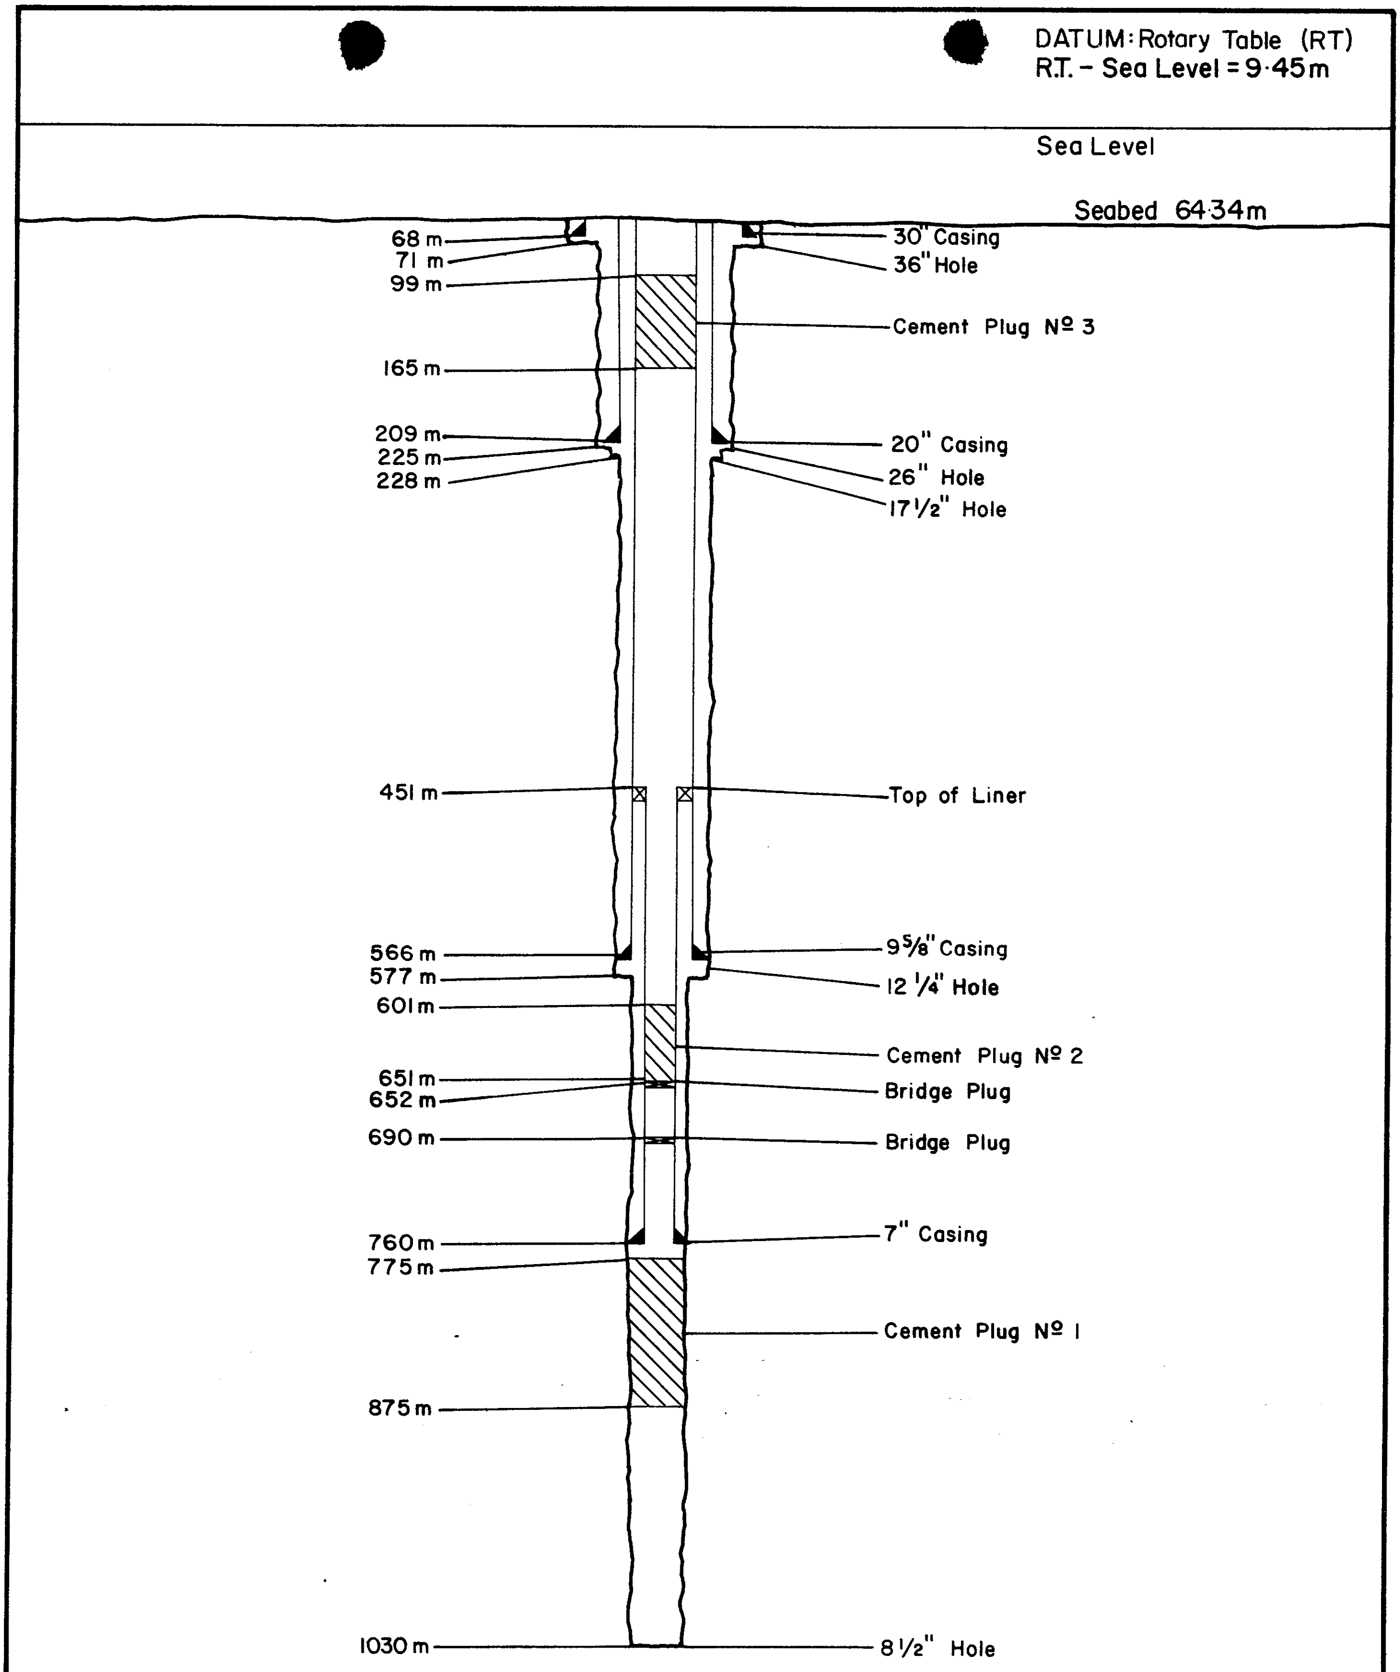
Casing shoe not drilled out.

2.7 Abandonment Report

(See As Abandoned Schematic per Figure 14.)

2.8 Recommendations for Future Drilling Programmes

The major problem encountered during drilling and evaluation of this well was the significant formation damage indicated by the production tests. This damage was deduced as directly a result of the type of mud system employed during the drilling phase. As a result of this information the following two wells (i.e. Whale No 1 and Sperm Whale No 1) were drilled with an inhibitive brine polymer mud system. This new mud system had minimal solids content and was in itself fully acid soluble.



NOTES:
1. Cement Plug Nº1 – 123 Sks. Class 'G' Neat, 15·8 PPG. 875m – 775m.
2. Cement Plug Nº2 – 30 Sks. Class 'G' Neat, 15·8 PPG. 651 m – 601 m.
3. Cement Plug Nº3 – 80 Sks. Class 'B' Neat, 15·6 PPG. 165m – 99m
4. DST Nº1 Perforations 706 m – 700m
5. DST Nº2 Perforations 670 m – 662m

☒ 7 _ WELL TESTING DATA _

- TEST PROCEDURE -

D.S.T. # 1

1) SCHLUMBERGER RUN IN HOLE WITH 4" CASING GUN (90° PHASING, 4 SHOTS PER FOOT) AND PERFORATE INTERVAL 700 - 706 M.

2) PACKER RUN IN AND SET AT 688 METERS.

3) TEST STRING RUN IN HOLE CONSISTING OF DOWELL P.C.T., 3½" HYDRIL PH6 TUBING, FLOPETROL SUB SURFACE SAFETY VALVE, "E.Z. TREE".

4) SURFACE EQUIPMENT RIGGED UP AND PRESSURE TESTED.

5) WELL WAS OPENED AND PRODUCING DRY GAS FOR AN INITIAL FLOW OF APPROXIMATELY 10 MINUTES. THE WELL WAS THEN SHUT IN TO OBSERVE BUILD-UP FROM THE SPRO GAUGE.

   ON OPENING AGAIN THE WELL WAS CLEANED UP ON ½" CHOKE WHICH WAS LATER INCREASED TO 1" FIXED.

   USING THE LARGER CHOKE, RATES WERE OBTAINED THROUGH THE SEPARATOR IN THE REGION OF ± 1.80 MMSCF/D WITH NO FLUIDS PRODUCED.

   A FINAL BUILD UP WAS AGAIN MONITORED USING THE SPRO SYSTEM THEN THE WELL WAS KILLED.

D.S.T. # 2

MIS-RUN,UNABLE TO SET POSI-TEST PACKER.

- TEST PROCEDURE -

1) SCHLUMBERGER RUN IN HOLE WITH 4" CASING GUN, 90° PHASING 4 SHOTS PER FOOT, AND PERFORATE INTERVALS 662 - 670 METERS.

2) POSI-TEST PACKER SET AT 648.13 METERS.

3) TEST STRING RUN IN HOLE CONSISTING OF DOWELL P.C.T., 3½" PH6 TUBING, FLOPETROL SUB SURFACE SAFETY VALVE, "E.Z. TREE".

4) SURFACE EQUIPMENT RIGGED UP AND PRESSURE TESTED.

5) WELL WAS OPENED, WITH PRESSURE INCREASING RAPIDLY, FOR A 5 MINUTE PRE-FLOW, FOLLOWED BY A BUILD-UP OF 40 MINUTES.

FOLLOWING THIS THE WELL WAS THEN FLOWED FOR CLEAN UP ON ½" CHOKE GIVING AN ESTIMATED FLOW RATE OF ± 3.5 MMSCF/D.

THE FLOW WAS THEN SWITCHED THROUGH THE SEPARATOR GIVING RATES OF 4.020 MMSCF/D.

AFTER 30 MINUTES FLOWING THROUGH THE SEPARATOR THE CHOKE WAS INCREASED TO 1" FIXED AND RATES OBTAINED IN THE REGION OF ± 6.3 MMSCF/D.

A FINAL SHUT IN FOLLOWED AND THEN THE WELL WAS KILLED.

Report N°: 2311812611[illegible]1

- GAS PRODUCTION RATE MEASUREMENT by orifice meter -

Reference is made to the rules and coefficients given in AGA gas measurement Comittee Report No. 3 for orifice metering.

a) EQUATIONS -

$$Q = C \sqrt{hw \times Pf'}$$

Q : Production rate at reference conditions.
C : Orifice flow coefficient.
hw: Differential pressure in inches of water.
Pf : Flowing pressure in psia.

$$C = F_u \times F_b \times F_g \times Y \times F_{tf} \times F_{pv}$$

F_u : Unit conversion factor in desired reference conditions.
F_b : Basic orifice factor (Q in Cu.ft / hour).
F_g : Specific gravity factor.
Y : Expension factor
F_{tf} : Flowing temperature factor.
F_{pv}: Supercompressibility factor (estimated).

Remarks

F_m: Manometer factor is equal one since only bellows type meters are used.
F_r : Reynolds factor is considered to be one.

TABLE OF F_u FACTOR

UNITS	REFERENCE CONDITIONS			
	60°F 14.73 psia	0°C 760mmHg*	15°C 760mmHg *	15°C 750mmHg *
Cu.ft / hour Cu.ft / day	1 24	0.9483 22.760	1.0004 24.009	1.0137 24.329
m^3 / hour m^3 / day	0.02832 0.6796	0.02685 0.6445	0.02833 0.6799	0.02870 0.6889

* Mercury at 32°F

b) METER DATA -

Meter type : DANIEL
Flange taps - Pf taken down/up stream
Flow recorder type: BARTON
ID of meter tube : 4.026"

c) SPECIFIC GRAVITY SOURCE -

Sampling point : GAS OUTLET LINE
Gravitometer type : KIMRAY

d) SUPFRCOMPRESSIBILITY FACTOR F_{pv} -

All coefficients are taken from AGA NX 19 manual for natural gas free of air, CO_2 and H_2S. More accurate values could only be determined by laboratory measurement.

SPECIAL DATA ANALYSIS

COMPANY HUDBAY OIL AUSTRALIA WELL BALEEN 1 FIELD GYPPSLAND
TEST N° 1 COUNTRY AUSTRALIA

Prepared by the
Reservoir Evaluation Department
of Dowell Schlumberger

ASSUMPTIONS MADE FOR CALCULATIONS OF LIQUID RECOVERIES

1. Q is averaged at a constant rate.
2. Pf is formation flowing pressure at a constant rate.
3. Formation flow is single phase, and any gas produced at surface is assumed to have separated in the drill pipe.
4. Radial flow is assumed.
5. Where specific reservoir parameters are not available, an Estimated Damage Ratio is calculated by assuming :

Effective permeability, K, is 1-200md	Formation porosity, Ø, is . . . . 10-30 %
Fluid compressibility, C, is . . . . 10^{-6} to 10^{-4}	Fluid viscosity, μ, is . . . . 0.05 to 50cp
Well bore radius, rw, is . . . . 3 7/8" to 4 3/8"	

which gives an average value for the function $\log \dfrac{K}{\varnothing \mu C r_w^2}$ of 5.5

6. Other standard radial flow equilibrium assumptions.

EMPIRICAL EQUATIONS

1. $\text{D.R.} = \dfrac{Po - Pf}{M\left[\log \dfrac{KT}{\varnothing \mu C r_w^2} - 2.85\right]}$ where $M = \dfrac{P1 - P10}{\text{log cycle}}$

2. $\text{Transmissibility} = \dfrac{Kh}{\mu} = \dfrac{162.6QB}{M}$

3. DST $J = \dfrac{Q}{Po - Pf}$ Theoretical $J = \dfrac{7.08 \times 10^{-3}\, kh}{\mu B \ln (re/rw)}$ Assumed $\ln(re/rw) = 7.60$

4. Radius of investigation, $ri = \sqrt{\dfrac{KT}{57{,}600\, \varnothing \mu C}}$ where T = flow time in minutes

5. $\Delta P \text{ Skin} = Po - Pf - \left[\dfrac{Po - Pf}{DR}\right]$ psi

ASSUMPTIONS MADE FOR CALCULATIONS FOR GAS RECOVERIES

1. Qg is steady state flow, and unless stated otherwise is at standard conditions, 14.7 psi and 60° F.
2. Pf is final formation flowing pressure at steady state flow.
3. Formation flow is single phase, and any liquid (condensate) produced at surface is assumed to have condensed in the drill pipe.
4. Radial flow is assumed.
5. Where specific reservoir parameters are not available, an Estimated Damage Ratio is calculated by assuming :

Effective permeability, K, is 1-200md	Formation porosity, Ø, is . . . .10-30 %
Fluid compressibility, C, is . . .. .10^{-6} to 10^{-4}	Fluid viscosity, μ, is . . . . . . .0.05 to 50cp
Well Bore radius, rw, is . . . . .3 7/8" to 4 3/8"	

which gives an average value for the function $\log \dfrac{K}{\varnothing \mu C r_w^2}$ of 5.5

6. If not given, gas specific gravity is assumed to be 0.7 (air 1.0), with a pseudo critical temperature of 385 Rankin and a pseudo critical pressure of 668 psia.
7. Other standard radial flow steady state assumptions.

EMPIRICAL EQUATIONS

1. $\text{D.R.} = \dfrac{Po^2 - Pf^2}{Mg\left[\log \dfrac{KT}{\varnothing u C r_w^2} - 2.85\right]}$ where $Mg = \dfrac{P_1^2 - P_{10}^2}{\text{log cycle}}$

2. $\text{Transmissibility} = \dfrac{Kh}{\mu} = \dfrac{1637\, Q\, Tr\, Z}{Mg}$

3. Radius of Investigation, $ri = \sqrt{\dfrac{KT}{57{,}600\, \varnothing \mu C}}$ where T = flow time in minutes

4. $\Delta P \text{ Skin} = Po - Pf - \left[\dfrac{Po - Pf}{DR} \text{ psi}\right]$

Customer : HUDBAY OIL AUSTRALIA **Well No. :** BALEEN 1 **Test No. :** 1

Tested Interval	Sand-stone	Lime-stone	Chalk	Clay	Shale	Other (please specify)
Major Mineral Species						
Minor Mineral Species						
Stringers or Lenses						

Is the tested interval : Open Hole : ☐ I.D. ☐ in

In Casing : ☐ O.D. ☐ in. Wt : ☐ lb./ft. I.D. ☐ in.

Open Hole Interval : (Total Depth) ________ (Foot of Casing) ________

Perforated Intervals : ________ ________ ________

________ ________ ________ ________

In the tested interval how many productive zones do logs show :

1 ☐ 2 ☐ 3 ☐ more ☐

What is the average porosity of the interval ? ☐ %

Is the interval homogeneous ? Yes ☐ No ☐

Is formation consolidation : Good ☐ Mod ☐ Low ☐

What is the clay content : % or High ☐ Mod ☐ Low ☐

Is the formation fractured Heavily ☐ Mod ☐ Little ☐

In this interval, is there expected near the wellbore :

Geological fault ? Yes ☐ No ☐

Interval thickness change ? Yes ☐ No ☐

Fluid phase contact ? Yes ☐ No ☐

—If yes :— Oil-Water ☐ Gas-Water ☐ Oil-Gas ☐

During drilling of the interval, was there :

Lost circulation ? Yes ☐ No ☐

Sand production ? Yes ☐ No ☐

Other (please specify) ________

Before testing was there a :

Scraper run ? Yes ☐ No ☐

Caliper run ? Yes ☐ No ☐

Mud circulation to bottom ? Yes ☐ No ☐

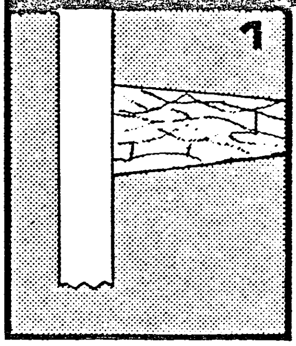
—If yes :— for how long ☐ If no, how long since ☐

Additional Comments : ________

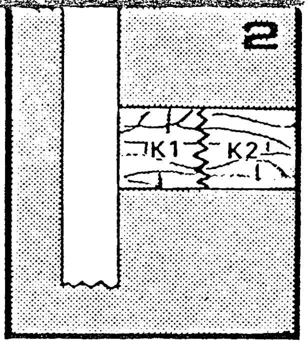
Customer Representative : ________

GEOLOGICAL INTERPRETATION GUIDE *

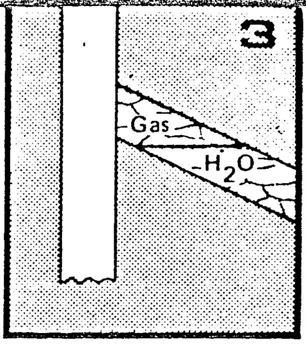
1 GENERAL CAUSES OF A BREAK UPWARD IN SLOPE VALUE



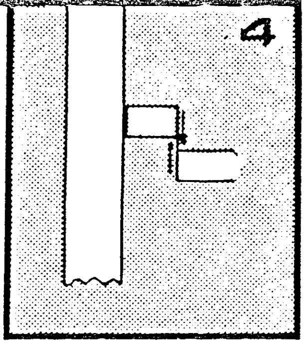
Decrease in thickness of pay zone away from well bore



Decrease in effective permeability away from well bore (facies change) K1 K2

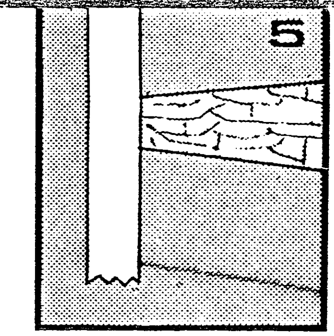


Increase in fluid viscosities away from the well bore (gas-water contact, gas-oil contact)

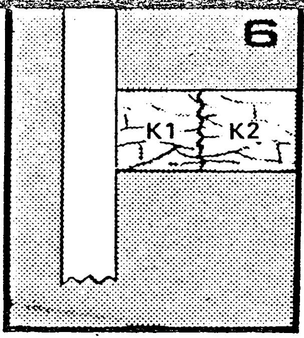


Sealing barrier (fault)

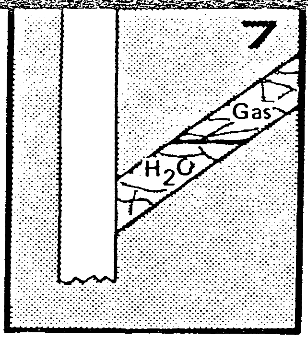
2 GENERAL CAUSES OF A BREAK DOWNWARD IN SLOPE VALUE



Increase in thickness of pay zone away from well bore

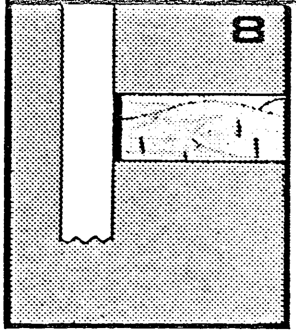


Increase in effective permeability away from well bore K1 K2

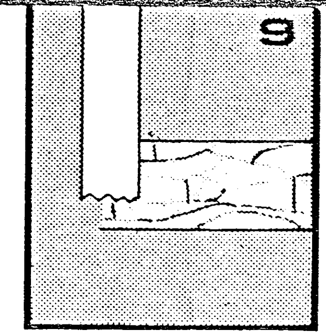


Decrease in fluid viscosities away from well bore

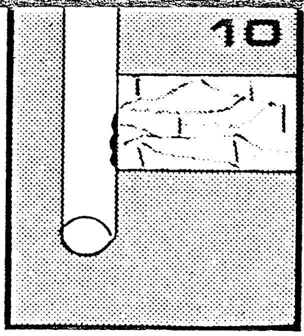
3 CONDITIONS WHICH WILL GIVE INDICATION OF DAMAGE OR STIMULATION



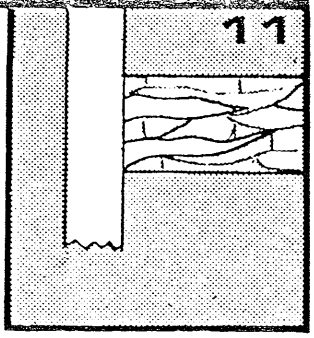
True Skin Damage - (Caused by : filtrate invasion, bit damage, drilling solids invasion, etc..)



Pseudo Damage - Incomplete penetration of porous zone



Pseudo Damage - Choking effect of perforations (cased hole)



Stimulation limited natural fracture system

* ILLUSTRATED CAUSES OF ANOMALIES DETECTED THROUGH PRESSURE BUILD-UP ANALYSIS

TECHNICAL REPORT

COMPANY HUDBAY OIL AUSTRALIA WELL BALEEN # 1 FIELD
TEST N° 2 COUNTRY AUSTRALIA

Prepared by the
Reservoir Evaluation Department
of Dowell Schlumberger

Dowell Schlumberger (Western) S.A.

(Incorporated with limited liability in Panama)

Telephone: 451 4319
Cables:
Telex: Orang AA 94215

January 7th, 1982

Dear Sirs,

The enclosed report would reflect a mechanically sound Drill Stem Test during which the tools functioned properly.

Visual inspection of all three charts showed a pressure kick during the Final Shut-In. Formation anomalies are usually not so abrupt in character so that a mechanical response would be suspect. The fact that the pressure surge occurred on all three recorders and at the same time would rule out recorder malfunction. The anomaly noted during the Final Shut-In should be viewed with caution.

The formation exhibited the characteristics of high permeability and damage was calculated. A portion of the damage could be psuedo caused by turbulent flow through the perforations. Well conditions should be reviewed to determine this factor.

Respectfully yours

John F. Viscarde

Report No. F 81113

Customer : HUDBAY OIL AUSTRALIA **Well No. :** BALEEN 1 **Test No. :** 2

Tested Interval	Sand-stone	Lime-stone	Chalk	Clay	Shale	Other (please specify)
Major Mineral Species						
Minor Mineral Species						
Stringers or Lenses						

Is the tested interval :

Open Hole : ☐ I.D. ☐ in

In Casing : ☐ O.D. ☐ in. Wt : ☐ lb./ft. I.D. ☐ in.

Open Hole Interval : (Total Depth) ______ (Foot of Casing) ______

Perforated Intervals : ______ ______ ______ ______

In the tested interval how many productive zones do logs show :

1 ☐ 2 ☐ 3 ☐ more ☐

What is the average porosity of the interval ? ☐ %

Is the interval homogeneous ?		Yes ☐	No ☐
Is formation consolidation :	Good ☐	Mod ☐	Low ☐
What is the clay content :	% or High ☐	Mod ☐	Low ☐
Is the formation fractured	Heavily ☐	Mod ☐	Little ☐

In this interval, is there expected near the wellbore :

Geological fault ?		Yes ☐	No ☐
Interval thickness change ?		Yes ☐	No ☐
Fluid phase contact ?		Yes ☐	No ☐
—If yes :—	Oil-Water ☐	Gas-Water ☐	Oil-Gas ☐

During drilling of the interval, was there :

Lost circulation ?	Yes ☐	No ☐
Sand production ?	Yes ☐	No ☐

Other (please specify) ______

Before testing was there a :

Scraper run ?	Yes ☐	No ☐
Caliper run ?	Yes ☐	No ☐
Mud circulation to bottom ?	Yes ☐	No ☐
—If yes :— for how long ☐		If no, how long since ☐

Additional Comments : ______

SYMBOLS USED

ΔT – INCREMENT OF TIME (MINUTES)

$\frac{T + \Delta T}{\Delta T}$ – DIMENSIONLESS TIME CONSTANT USED FOR THE HORNER PLOT

ΔT IS THE INCREMENT OF SHUT-IN TIME '(MINUTES)

T IS TOTAL FLOW TIME PRECEDING SHUT-IN (MINUTES)

LOG – LOGARITHM TO BASE 10 OF $\frac{T + \Delta T}{\Delta T}$

Pw – Pf – PRESSURE BUILD-UP ABOVE FINAL FLOWING PRESSURE PRECEDING THE BUILD UP WHICH IS USED FOR THE MCKINLEY PLOT.

FINAL POSITIONING

FINAL POSITION

CONCLUSIONS AND RECOMMENDATIONS

DAILY LOG

INTRODUCTION

The Baleen-1 positioning survey was conducted between 30th October and 5th November, 1981.

The survey consisted of:

1. Setting up the trisponder survey net.
2. Checking the survey systems.
3. Positioning and setting the anchor buoys.
4. Determining the final rig position.

Decca Survey Australia Ltd. supplied both personnel and survey equipment.

The equipment used to conduct the survey consisted of:-

1. Two Trisponder receivers.
2. One Satellite receiver - (JMR-4).
3. Four onshore Trisponder base stations.

The Trisponder was the primary navigation system used to position the rig with the satellite navigation system as an independent check and a 100% backup.

A licenced surveyor contracted from Navigation Australia was on board during the Baleen-1 positioning to verify Decca's readings.

A HOAL Geophysicist was also on board to supervise the survey.

Independent reports will be submitted by Navigation Australia and Decca Survey Australia.

PROPOSED RIG LOCATION

The proposed rig location for Baleen-1 was shotpoint 300, line GB81-31.

The co-ordinates for the position were:-

Latitude	038°	00'	36.01"	S
Longitude	148°	26'	08.74"	E

UTM co-ordinates from Central Merridian 147°

5792088.0 metres North
0626042.5 metres East

The following base stations were used for the survey:-

	Easting	Northing
Mt. Cann	674487.5	5831332.7
Raymond	640921.4	5824777.0
Jemmy	584670.0	5806793.0
Nowa Nowa	596073.9	5827551.6

The distances to the proposed Baleen-1 well from the base stations were:-

Mt. Cann	62359 metres
Raymond	35924 metres
Jemmy	43920 metres
Nowa Nowa	46445 metres

ANCHOR PATTERN AND BUOYS

Using the given bow heading of 230°, anchor line bearings, and anchor cable and chain length of 457.2 metres, the positions of the anchor buoys were determined graphically.

The following table lists the positions:

Anchor Buoy No.	Bearing	Easting	Northing
1	260°	625544.5	5791993
2	290°	625575.5	5792225
3	350°	626007.5	5792576
4	20°	626250.5	5792551
5	80°	626542.5	5792182
6	110°	626512.5	5791940
7	290°	626070.5	5791603
8	200°	625827.5	5791631
Bow Heading	230°		

The anchor buoys consisted of a 51 mm pipe approximately 5.5 metres long with a Norwegian buoy at the centre. A 0.6 metre section of chain was attached to the bottom and a coloured pennant was attached to the top. These were anchored by two 1 metre steel rails weighing approximately 68 kgm each. Three concrete cylinders were also attached to the base of each buoy to keep the pipe vertical. 60 metres of rope were used at each anchor, to allow a maximum swing of approximately 24 metres.

DAILY LOG

Thursday 29th October

2300 hrs.	Hong Sit and Rod Keene of Navigation Australia departed Perth.

Friday 30th October

0500 est.	Arrived Melbourne Airport.
0600 hrs.	Driving to Bairnsdale.
1030 hrs.	Arrived at Bairnsdale.
1245 hrs.	Departed Bairnsdale by helicopter
1255 hrs.	Arrived on rig "Petromar North Sea".
1415 hrs.	On board supply boat "Yardie Creek"

Saturday 31st October

0945 hrs.	Alongside Esso "Tuna" platform for position checks
1025 hrs.	Departed "Tuna" platform
1130 - 1355 hrs.	Checking Fathometer sections
1645 hrs.	At anchor off Marlow

Sunday 1st November

0700 hrs.	En route to "Baleen" location
0830 - 1030 hrs.	Laying buoy pattern
1030 - 1200 hrs.	Checking Pattern
1330 hrs.	En route Pt. Welshpool

Monday 2nd November

0130 hrs.	Arrived Pt. Welshpool
1300 hrs.	R. Keene Navigation Australia, J. Duncan Decca Surveys, H. Sit Hudbay departed Pt. Welshpool by vehicle for Bairnsdale.
0500 hrs.	Arrive Bairnsdale
0645 hrs.	Depart by helicopter for rig
0655 hrs.	Arrive "Petromar North Sea"
1200 hrs.	Equipment arrives on helicopter

Monday 2nd November

1200 - 1500 hrs.	Erecting Trisponder radio and Satellite receiver on bridge of rig. Awaiting movement of rig.

CONCLUSIONS AND RECOMMENDATIONS

The Baleen-1 well positioning was completed satisfactorily, however there were certain difficulties:

1. Insufficient weight was attached to the buoy anchors and they were subsequently swept out of position by up to 6 kilometres. No extra weights were available on board; only 5 buoys were finally dropped to allow extra weights to be applied.

2. Two lengths of railing line approximately 1 metre in length were used during the survey. It is recommended in future that at least four pieces be used.

All personnel involved in the survey performed extremely well and high professional standards were maintained by the positioning crews from Decca and Navigation Australia.

SURVEY NET VERIFICATION AND SURVEY CHECKS

Esso's "Tuna" platform was chosen to check the Trisponder Survey net. Due to the heavy seas it was not possible to get too close alongside the "Tuna". However, three fixes were taken approximately 40 metres from the co-ordinated position. These fixes resulted in differences of approximately 20 metres west and 10 metres north from the true position.

Two seabed topographic features on lines GB81-37 and GB81-40 were also used to verify the survey net to make sure that the survey net used to position the rig matched that used in the seismic recording. The attempt to "re-occupy" these two seismic lines proved to be very satisfactory as the features appeared within 20 metres of the proposed location.

The Anchor buoys were layed at the "Baleen" location on Sunday 1 November between the hours 0830 and 1030. The co-ordinates of the buoys were checked soon after the last buoy was down. The moonpool buoy had to be re-positioned as it was found to be approximately 120 metres out of position.

The supply boat "Yardie Creek" then sailed to Port Welshpool, to allow one set of Trisponder equipment to be placed on board the "Petromar North Sea". This enabled the rig position to be constantly monitored when mooring onto the location.

The "Yardie Creek" returned on 2nd November to the Baleen location. All anchor buoys were out of position by up to six kilometres due to insufficient weights attached to the buoys. All buoys except one were recovered and relayed on a new heading of 210° (requested by the drilling superintendent). Only buoys No. 1, 3, 5, 8 and the moonpool were layed in order to allow extra weights to be attached to the buoys and a check made between the hours 1420 and 1510 confirmed that all the buoys were within 50 metres of the proposed location.

FINAL POSITIONING

The "Petromar North Sea" departed the "West Seahorse" location at 1400, Tuesday 3rd November. It arrived on "Baleen" location at 2000 and the first anchor, no. 5, was dropped at 2135. At 1225, Wednesday 4th November, the last anchor was dropped. Trisponder signals were extremely good throughout.

FINAL POSITION

The final position of the Baleen No.1 well is:

Latitude	038°	00'	36.630"	SOUTH
Longitude	148°	26'	08.400"	EAST

UTM Co-ordinates from 147° Central Merridian

Northing	5792068 metres
Easting	626032 metres

The stem is 23 metres at a bearing of 207.7° from the proposed location.

Final distances to the Baleen No.1 well from the base stations are:

Mt. Cann	62350 metres
Raymond	35913 metres
Jemmy	43919 metres
Mt. Nowa Nowa	46441 metres

The JMR-4 Satellite Doppler observations were taken on board the rig to check the Baleen-1 location established by the Trisponder observations. The satellite positions after 4 passes was:

Latitude	038°	00'	36.582"
Longitude	148°	26'	08.239"

Tuesday 3rd November

	Awaiting movement of rig.
1430 hrs.	"Petromar North Sea" departed West Seahorse location
1900 hrs.	Arrived "Baleen" location
2035 hrs.	Dropped 1st anchor

Wednesday 4th November

1225 hrs.	Last anchor in location
1625 hrs.	Rig on location and all anchors tensioned up
	Final location fixes commenced

Thursday 5th November

0640 hrs.	Final fix taken
0735 hrs.	Keene, Duncan, Sit departed rig by helicopter to Bairnsdale
0755 hrs.	Arrive Bairnsdale
0810 hrs.	Depart Bairnsdale by light aircraft for Melbourne airport
0920 hrs.	Arrives Melbourne
0925 est.	Depart Melbourne
1130 est.	Arrive Perth.

3.0 GEOLOGY

(Pages 23 - 43)

3.0 GEOLOGY

3.1 Summary of Previous Investigations

Gippsland Basin exploration commenced in 1924 with the reported discovery of oil and gas in a water bore drilled onshore near Lakes Entrance. To date, over 125 wells have been drilled in the onshore part of the basin but only minor hydrocarbon accumulations have been encountered.

The initial exploration in the offshore Gippsland Basin was by the Bureau of Mineral Resources, for whom a regional gravity and aeromagnetic survey was conducted between 1951 and 1956. The first permits, covering a large part of the offshore Gippsland Basin, were taken up by BHP Co. Ltd. (later Hematite Petroleum Pty. Ltd.) in 1960. Esso joined the original permittee in 1964 and the first offshore well, Barracouta No.1, was drilled in 1965. Over eighty offshore wells have been drilled in the basin resulting in the discovery of recoverable reserves of approximately 3 billion barrels (0.466×10^{12} m^3) of oil and 8 trillion cubic feet (220.4×10^{12} m^3) of gas.

A summary of early contributions to the understanding of the geology and hydrocarbon potential of the Gippsland Basin was presented by W.F. Threlfall and others in 1974. Esso-BHP have published several papers on basinal stratigraphy and geological evolution during their exploration and development of the basin, and papers dealing with the geology of individual fields have been published as the fields were developed.

Exploration Permit Vic/P-11 consists of 51 blocks which previously formed parts of Exploration Permits Vic/P-1 and Vic/P-8, held respectively by Esso-BHP and a consortium headed by BOC Australia. The area now covered by Vic/P-11 was gazetted in December 1976 and applications for the permit were invited. The permit was granted to Gas and Fuel Corporation of Victoria on August 8, 1978, and Beach Petroleum subsequently became joint Permittee and Operator.

Hudbay Oil (Australia) Ltd. farmed into the Permit in December, 1980, and in February 1981 shot the GB81 Seismic Survey, consisting of 359 line kilometres of 36-fold seismic. Detailed mapping, incorporating data from the GB81 survey, Beach Petroleum's GB79 Seismic Survey and trade data from Esso's G80A Seismic Survey, defined several prospects.

3.2 Geological Setting

3.2.1 Regional Setting

The Baleen structure lies towards the northern margin of the Gippsland Basin, which is situated in south-eastern Australia and is bounded to the north and south by the Victorian Highlands and Bassian Rise respectively (Enclosure 2). The western limit of the basin is taken as the Mornington Peninsula and to the east the basin opens to the Tasman Sea. The Gippsland Basin covers approximately 50,000 km^2 and is filled with up to 10,000 metres of Lower Cretaceous to Recent sediments.

3.2.2 Tectonic Elements (Enclosure 2)

The offshore Gippsland Basin is separated by fault complexes into three major divisions: The North Platform, or Lakes Entrance Platform; the graben-like Central Deep or Strzelecki Basin; and the South Platform (Hocking & Taylor, 1964; James and Evans, 1971; Hocking, 1972).

The stable platforms to the north and south are areas where the Tertiary sequence unconformably overlies Palaeozoic basement. In these areas the structures within the Tertiary section consist simply of small-scale drapes over palaeotopographic ridges and small fault scarps.

The Southern Platform is separated from the Central Deep Basin by a major fault complex, the South Bounding Fault. This is an offshore extension of the Foster Fault System and consists of a system of down-to-basin normal faults arranged en echelon. The northern boundary of the Central Deep is less well defined.

Major fault trends within the central part of the basin are offshore extentions of the east-west trending Foster Fault and the antithetic, east-west trending Rosedale Fault System. In the Baleen area the latter is known to be a reverse fault superimposed upon an older normal fault within the Lower Cretaceous, and has a throw of up to 160 metres. Reverse movement along the fault system is believed to have occurred as a result of the same stresses that led to the development of the major anticlines in the central basin during the late Eocene to early Oligocene.

Numerous northwest-southeast, basin-forming normal faults have been recognized within the Central Deep. The general trend of these faults is approximately parallel to that of the faults in the neighbouring Bass Basin.

The major hydrocarbon-bearing anticlinal structures in the central basin are elongate, with a dominant southwest-northeast axial trend. They were formed by right-lateral, convergent shearing brought about by the movement of continental plates, as discussed in Section 3.2.3. The main hydrocarbon traps in the Vic/P-11 Permit were formed as a result of this same shearing stress, by arching associated with reverse movement superimposed upon older normal faults.

3.2.3 Geological Evolution and Regional Stratigraphy (Figure 15)

During the Lower to Middle Palaeozoic a series of major orogenies occurred within the Tasman Geosyncline. This resulted in a dominantly north-south structural grain within the tightly folded and faulted Palaeozoic metamorphics. These geosynclinal sediments were subsequently intruded by Lower Devonian granitic rocks. A major rift formed across southern Australia during the Jurassic due to the separation of the Antarctic and Australian cratons. The rift valley formed over the entire length of the present southern coast of Australia. Into this major depositional axis a typical sequence of rift valley sediments was rapidly deposited, as clastics were stripped from the adjacent Palaeozoic highlands. The initial deposits of the Upper Jurassic to Lower Neocomian consist of conglomeratic wedges and alluvial fan detritus, commonly of a quartzose sandstone nature. Jurassic intrusives and Lower Cretaceous extrusives, both associated with rifting, provided a major provenance for 3,500 metres of Lower Cretaceous Strzelecki Group sediments.

During Lower Cretaceous times the Gippsland Basin formed a half graben with the major subsidence along the southern Foster Fault system. The Strzelecki Group sediments are texturally mature but mineralogically immature, being felspathic and chloritic. They consist of a monotonous cyclic sequence of interbedded sands, silts and muds deposited on a subsiding fluvial plain. A large east-west rift developed, separating sediments of the Tasman Geosyncline. The eastern end of this rift is believed to have terminated in a triple junction formed by the Australian, Antarctic and Lord Howe Rise plates. The western arm of the triple junction was coincident with the ancestral Otway and Gippsland Basins and, as this arm of the triple junction failed during the Turonian, the Lord Howe Rise plate moved eastwards away from the Australian-Antarctic plate. This resulted in the rifting of the eastern portion of the Antarctic and Australian plates along a line parallel to, and off the west coast of Tasmania. Therefore the Tasmanian craton remained attached to the Australian plate but was separated from it by an east-west, aborted rift valley basin.

The Lower Cretaceous Strzelecki Group sediments are unconformably overlain by up to 5,000 metres of fluviatile and lacustrine Latrobe Group sediments. Upper Cretaceous sedimentation tended to be superimposed on the underlying Strzelecki Group with the deposition of shales, minor coals and poorly sorted sandstones in a fluviatile environment. In the early Senonian, approximately 85 million years B.P., the Lord Howe Rise Plate separated, resulting in the deposition of a complex system of fluvial and deltaic plain sediments sourced from the northwest and north. Growth and movement on the basin-forming normal faults resulted in continued subsidence of the basin during the Palaeocene and Eocene.

The northern part of the basin was uplifted as fault movement elsewhere in the basin lessened during the Eocene. A period of submarine and subaerial channel-cutting occurred during the Middle to Upper Eocene in the Tuna-Flounder area. The channel-cutting marked the onset of a marine transgression from the southeast during the uppermost Eocene to Lower

Oligocene, a period of instability and basin tilting. The en echelon disposition of the fold trends and fault systems is most likely the result of Upper Eocene east-west, right lateral, convergent shear deformation. The crestal areas of the folds were subsequently eroded during an associated period of relative sea level drop, while the deeper parts of the regime reactivated the severe channeling and the Marlin Channel was formed as subaerial and submarine drainage systems were laterally restricted.

The transgression continued into the Lower Oligocene with the deposition of the shallow water glauconitic sands and silts of the Gurnard Formation. Around the margins of the basin, sand buildups occurred as the transgression reached its maximum extent. During the uppermost Eocene to Lower Oligocene a marked change in sediment type occurred: the fluvial and deltaic coarse grained clastics were replaced by fine grained, calcareous shales and marls. The change in sediment type may be, in part, due to a change in provenance related to the widespread deposition onshore of volcanics during the Upper Eocene wrenching episode.

Sealevel fluctuations during the Miocene produced a complex system of interfingering and overlapping channels, which cut into the soft limestones and marls of the Lakes Entrance Formation and Gippsland Limestone. A linear, submarine slump zone of over 125 kilometres in length has been observed along the major south-bounding fault system. A wedge of sediment moved towards the centre of the basin as a result of reactivation of this fault system during the Miocene. A major cratonic uplift, the Kosciusko Uplift, was initiated in the Miocene and culminated during the Upper Pliocene and Lower Pleistocene. The Victorian Highlands were uplifted and provided a renewed clastic provenance, while faults and associated structures around the northern margins of the basin were rejuvenated. Extensive erosion is currently occurring in the Strzelecki Hills and a relatively thin veneer of Quarternary sediments is being deposited across the southeastern Gippsland coastal plain.

Figure 15

3.3 Stratigraphy

A sedimentary section ranging in age from Lower Cretaceous to Recent was penetrated in Baleen No.1 (Figure 16).

Age determinations are based upon palaeontological and palynological studies of sidewall cores (Appendices B1 & B2). The boundaries of individual units were established by using the age determinations in conjunction with lithological data, from the microscopic examination of drill cuttings and sidewall cores, and wireline log interpretations. Time-rock subdivisions were placed midway between sidewall core points, unless more accurate subdivisions were made possible by log response or cuttings lithology.

Owing to the standard practice of not installing a marine riser until after the setting of the 20 inch casing, no samples were recovered from the seabed to 209 metres.

The stratigraphy encountered in the well is described below. All depths quoted are below the Rotary Table, which is 9.45 metres above Mean Spring Low Water.

Lower Cretaceous (1030 - 707 metres)

Undifferentiated sandstones, siltstones and claystones typify the Lower Cretaceous at Baleen No.1. All lithologies have high matrix contents and grain-sizes are generally very fine to fine. Minor coal seams occur at 930 metres and silicified bands occur within the more coarse lithologies. Wireline log evidence indicates the possibility of a weathered zone between 850 and 707 metres. The appearance of Coptospora paradoxa confirms the presence of non-marine Strzelecki Group sediments at 709 metres and the unconformity is interpreted at 707 metres.

Str gp

Upper Eocene (707 - 653 metres)

Latrobe gp

The unconformity at 707 metres marks the base of the Upper Eocene sediments and represents the onset of a marine transgression of the area. Poor yields prevented reasonable palaeontological age determinations within this interval but palynological examination indicated nothing older than the Middle N. asperus zone. Lithologically, the interval consists of two iron oxide/carbonate rich, sandstone-siltstone bands separated by a glauconitic and micaceous claystone-siltstone-sandstone sequence (Appendix B3).

Upper Eocene (653 - 638.5 metres)

[illegible]

The Latest Eocene is represented by a continuance of the glauconitic claystones, with an increasing amount of calcareous material. Zone K planktonic foraminifera were recognized, with plant micro fossil assemblages more confidently assigned to the Late N. asperus zone. The interval was deposited in water depths of less than 10 metres, probably in an estuarine entrance.

Lower Oligocene (638.5 - 627 metres)

[illegible]

The interval consists of a sequence of glauconitic claystone with minor calcilutite and calcisiltite. This has been assigned to Taylor's Zone J, and is thought to have been deposited in an inner shelf environment in water depths of about 10-40 metres. An unconformity marks the top of this zone.

[illegible] Fm

Latest Oligocene to Lower Miocene (627 - 545 metres)

This section consists of interbedded calcisiltite and claystone with skeletal fragments but has been separated from the overlying interval on the basis of planktonic foraminifera. Above approximately 604 metres, the unit was assigned to Zone H-1 and was apparently deposited in water depths of about 200 metres in a mid shelf canyon. Between about 627 metres and 604 metres, the unit was assigned to Zone H, and is believed to have been deposited on an upper slope fan in water depths of 200-300 metres.

Lower Miocene (545 - 447 metres)

transition zone

A decrease in the proportion of clay and finely divided carbonate material over skeletal fragments brought a gradation over this interval from calcisiltites and calcareous claystones to skeletal calcarenite. This is indicative of decreased water depths in the area of deposition from about 200 metres to 40 metres. Planktonic foraminifera from Zones G to F were recognized, and a mid shelf canyon is believed the most likely environment of deposition.

Middle Miocene (447 - 343 metres)

Gipps L's

Above 447 metres the Middle Miocene again consists of dominantly very coarse skeletal fragments with minor calcisiltite and calcilutite. The section is believed to have been deposited in a canyon head environment, in water depths of about 40 metres, and contained planktonic foraminifera from Zones E to D.

Middle Miocene to Recent (343 - 225 metres)

The upper section of the Gippsland Limestone was represented in Baleen No.1 by skeletal calcarenite with minor calcisiltite and calcilutite. Faunal types recognized included corals, echinoids, pelecypods, bryozoans and forams. Such an assemblage indicates deposition in an inner continental shelf environment, in water depths of about 10-40 metres, and corresponds to Planktonic Foraminiferal Zones C to A of Taylor (in prep.).

BALEEN - 1

STRATIGRAPHIC TABLE

Date:
July, 1982

Drawing Nº
A4-GL-582

Figure 16

3.4 Structure

Baleen No.1 was drilled on the southern side of a major east-west, high angle reverse fault which is upthrown to the south, i.e. towards the centre of the basin. Reverse movement, associated with wrenching along a pre-existing, normal, down-to-the-basin fault trend, caused arching into the fault and thereby formed the northern boundary of the structure.

The normal fault trend formed during Upper Jurassic to Lower Cretaceous times, with further growth continuing during the Upper Cretaceous and Lower Tertiary. The reverse movement is believed to have been associated with the wrench faulting which took place during the Upper Eocene to Lower Oligocene.

The Baleen structure consists of two culminations separated by a minor saddle, with closure extending over 10 kilometres in an east-west direction. Closure has been mapped at two horizons, designated "Top Latrobe" and "Top Strzelecki".

A high resolution dipmeter was run over the interval from 566-1029 metres. Interpretation of the dipmeter data was enhanced by the use of a Cluster-Pooled Arrow Plot, Cyberdip and a Geodip run over selected intervals. The dipmeter data have been divided into different intervals, based on the magnitude and direction of the recorded dips, as follows:

570 - 597 m : Dips ranged between 5-30°, with a southerly orientation.

598 - 604 m : 3-8°, northeasterly orientation; possible transition zone.

604 - 609 m : 3-6°, southerly orientation.

611 - 639 m : 14-34°, north-northeasterly orientation; dip readings sparse.

640 - 658 m : No reliable trends.

658 - 700 m : 9-40°, general south-westerly orientation; readings widely spaced.

700 - 750 m : Extremely low frequency of readings; southerly trend.

750 - 778 m : 8-25°, south-easterly orientation.

778 - 790 m : No reliable readings.

790 - 898 m : 6-26°, mainly between east and south.

903 - 957 m : 5-36°, orientation poorly defined, between northeast-southwest, dominantly easterly.

959 - 962 m : 17-30°, north-westerly orientation.

966 - 1031 m (T.D.): 3-22°, between northwest-south; averaging 10° easterly.

Below 750 metres, the Cyberdip and Cluster dipmeter logs show evidence of a structural dip component of between 6-12° to the south and east. Due to the low frequency of readings above 750 metres a structural component was not removed prior to processing the Geodip log.

3.5 Predicted vs Actual Depth to Seismic Marker

Several seismic events were recognized in Baleen No.1 and well data has shown these to be related to significant lithological changes and age boundaries. The recorded data is listed in the following table. Further information can be found in Enclosures 3 and 4, and Figure 17.

Horizon Identification - Baleen-1

Horizon	Predicted Depth*	Actual Depth	Two-way Time (sec)
Sea Floor	53 m	54.9 m	0.073
"Top Latrobe"	617 m	617.5 m	0.619
Top Iron Nodule Band	N/A	644.0 m	0.645
"Top Strzelecki"	747 m	697.5 m	0.696
Near Base "Weathered Zone"	N/A	840.5 m	0.825
Total Depth	1000 m	1020.5 m	0.922

kb - 9.45m.

* Note: Depths quoted in this table are subsea.

The event identified as "Top Latrobe" and predicted at 613 metres subsea was encountered at 644 metres. It corresponded with the top of an iron nodule band. The "Top Strzelecki" horizon was predicted at 747 metres subsea but was encountered at 697.5 metres.

3.6 Porosity and Permeability

Porosities for Baleen No.1 have been estimated by microscopic examination of drill cuttings and wireline log interpretation (Appendix B4).

The three hydrocarbon bearing intervals, 660-672m, 672-696m and 696-707m, have average log-derived porosities of 30%, 26% and 25% respectively. From 660-696 metres, the sediments were fine-grained, poorly-sorted mixtures of clay minerals, quartz silt and fine quartz sand, with gluaconite and limonite (Appendix B3). RFT's and a Drill Stem Test over the interval 662-670m, confirmed that the interval had suspected formation damage and indicated a formation permeability of only 56 md.

The zone from 696-707 m, contained coarse sand with less clay and silt-sized material than the overlying interval and calculations based on a DST over this interval indicated a formation permeability of 747 md. Extremely high skin effects were observed due to formation damage.

Log derived porosities below 707 metres averaged 20% within the Strzelecki Group sediments (Appendix B4). These are regarded as being high considering the argillaceous matrix of RFT's also indicate that the formation is tight and that the Strzelecki Group doesn't form a reservoir unit at the Baleen-1 location. However where the permeability within these sediments is better developed, it will be a valid secondary target.

3.7 Hydrocarbon Indications

3.7.1 Summary

Interpretations of wireline logs indicated three hydrocarbon-bearing zones in Baleen No.1: these were between 660-672 m, 672-696 m and 696-707 m. Drill Stem Tests of the upper and lower zones produced dry gas from each zone.

3.7.2 Hydrocarbon Indications During Drilling

Continuous Gas Monitoring

A continuous record of gas levels in the drilling mud was maintained by Exploration Logging Inc., using a total gas analyser and gas chromatography. Monitoring commenced at 225 metres, in the 12-1/4" hole.

The following table summarizes the gas readings observed during drilling:

Range of Gas Readings

Depth (m)	Total Gas	Pet. Vap.	C_1	C_2	C_3	iC_4	nC_4	C_5
225-460	0	0	0	0	0	0	0	0
460-525	Tr-2	0	20-600	0	0	0	0	0
525-640	2-22	0-Tr	400-5300	0-20	0-10	0-30	0-Tr	0
640-653	20-100	Tr-1	400-8950	Tr	Tr	0-30	Tr	0
654.5	500+	1+	(Gas trap indicated - sample not analysed)					
655-665	(No readings after gas kick)							
665-745	3-44	0-Tr	375-13222	0	0	0-20	0	0
745-1030 (T.D.)	Tr-12	0-Tr	20-1790	0	0	0-39	0	0

Notes:
1) "Petroleum Vapours" includes C_2 and higher hydrocarbons.
2) Total Gas and Petroleum Vapours are given in units, where 1 unit = 200 ppm.
3) C_1 - C_5 are given in ppm.
4) Gas chromatograph malfunction was responsible for the loss of some higher hydrocarbon records, i.e. C_3, iC_4 and C_5.

Fluorescence from Drill Cuttings

Examination of drill cuttings showed traces of fluorescence at 605-610 metres and between 650-725 metres. The fluorescence was described on claystones as being spotty yellow or yellow-white with fast, green-white or creamy white solvent fluorescence, with similar indications described on sandstones below 700 metres.

All samples were contaminated to some degree of petroleum derivatives, notably diesel fuel, from the drill water which was supplied to the Exlog unit.

Oil Staining/Free Oil

Possible light brown staining was observed on siltstones from 670-675 metres.

3.7.3 Sidewall Cores

Isolated specks of dull, gold fluorescence were observed in nine of the sidewall cores, the highest being at 623.0 metres and the lowest at 927.0 metres. In all cases the samples produced either no solvent fluorescence or extremely pale solvent fluorescence.

Further details are given in Appendix B5.

3.7.4 Further Indications

DST-1 over the interval 700-706 metres flowed dry gas at rates up to 1.8 MMcf/D through a 1" choke. DST-2 over the interval 662-670 metres flowed dry gas at rates up to 6.3 MMcf/D through a 1" choke. Section 2.5 of this report summarizes the testing programme. Analyses of the gas samples can be found in Appendix B6.

3.8 Contributions to Geological Knowledge

1. It is interpreted that a faster rate of sedimentation occurred during the basal Miocene at Baleen than at the Flathead and Lakes Entrance locations. Sedimentation occurred in palaeo water depths of 200-300 metres and is interpreted as part of a marine canyon complex.

2. The lack of significant Oligocene section indicates a hiatus of some 5 million years during the Oligocene at the Baleen location.

3. The Upper Eocene sequence has been interpreted as marine with petrological variations coincident with sea level fluctuations during the Upper Eocene. It is therefore proposed that no Latrobe Group sediments were penetrated.

Poor geology

4. The Baleen No.1 well confirmed the presence of suitable reservoir rocks within the "marine transgressive unit". Porosities decreased with depth from 30-20% over the interval 660-707 metres which constituted the hydrocarbon zone.

5. Production tests confirmed the presence of hydrocarbons, with DST's flowing dry gas at rates of up to 6.3 MMcf/d and formation permeabilities in excess of 800 md.

6. Abnormally high skin effects were observed during the production tests at Baleen-1 due to formation damage. Flow rates in excess of 20 MMcf/d are anticipated if formation damage is kept to a minimum.

7. Palynological studies of sidewall cores at Baleen dated the upper section of the Strzelecki Group to be of Albian age (Lower Cretaceous). This is amongst the youngest Strzelecki Group sediments penetrated in the Gippsland Basin.

8. Although the Strzelecki Group sediments at Baleen-1 were tight they would be considered as a valid target if permeabilities were better developed.

4.0 WELL DATA

4.1 Formation Sampling

A standard "Alpha" unit from Exploration Logging Australia Inc. was used for the 1981-82 Gippsland Basin drilling programme. Exlog personnel provided continuous monitoring of ditch gas and mud pit levels, and recorded the following parameters, together with ditch gas, every 5 metres : gas chromatography, calcimetry, blendor gas analyses and mud weight in and out. Corrected drilling exponent calculations were also performed every 5 metres in shaly intervals, but are not considered reliable due to a faulty motion compensator on the drilling vessel. A Drill Monitor System panel provided continuous readings of engineering/drilling parameters, which were noted every 5 metres.

Washed and dried cuttings samples were collected in 5 metre (minimum) compilations from below the base of the 20" casing shoe, at 209m, to the Total Depth at 1030m. Hudbay and Exlog geologists maintained separate lithological logs (see Enclosures 5 & 6 and Appendix B7).

400g unwashed, 15m composite samples were bagged from below the 20" casing shoe and 100g unwashed, 15m composite samples were taken from below the 9-5/8" casing shoe, at 564m. The former were submitted for palynological study; the latter were sealed with preservation in cans and submitted for geochemical analysis.

4.2 Coring Programme

4.2.1 Conventional Cores

No conventional cores were cut in Baleen No.1.

4.2.2 Sidewall Cores

Summary

Suite 1 (09/11/81)
Interval Shot : 230.0 - 551.7 metres
Shots Attempted : 30
Cores Recovered : 30
Bullets Empty : Nil
Bullets Misfired : Nil
Bullets Lost : Nil

Suite 2 (18/11/81)
Interval Shot : 566.0 - 1030.0 metres
Shots Attempted : 60
Cores Recovered : 52
Bullets Empty : 4
Bullets Lost : 4
Bullets Misfired : Nil

Total : 90 Shots 82 Recovered

BALEEN — 1.

4.3 Wireline Logs and Wireline Sampling

Schlumberger Seaco ran the following wireline logs and Repeat Formation Tests in Baleen No.1:

Suite	Date	Logs	Interval (m)	Remarks
1	09/11/81	FDC-GR (1:200 & 1:500)	208.0 - 575.3	
		DIT-BHC-GR (1:200 & 1:500)	208.5 - 573.5	Recorded GR to 65 m
		CST (1:200)	230.0 - 551.7	
2	17/11/81	FDC-CNL-GR (1:200 & 1:500)	566.0 -1030.0	
		DLL-MSFL-GR (1:200 & 1:500)	566.0 -1025.0	
		BHC-GR (1:200 & 1:500)	566.0 -1025.0	
		HDT (1:200)	566.0 -1029.0	
	18/11/81	RFT-GR	661.0 - 998.5	5K gauges used in pressure test, halve all pressures.
		CST (1:200)	581.0 -1014.1	Two runs of the CST were made.
	21/11/81	CBL-VDL (1:200)	440.0 - 718.5	
	23/11/81	Perforation Record (1:200)	700.0 - 706.0	
	27/11/81	Bridge Plug Setting Record (1:200)	634 - 652.0	

Additional Services

Date	Logs	Interval (m)
17/11/81	Cyberlook (1:200)	566.0 -1029.0
05/12/81	Continuous Dipmeter (Cluster with Dipmean) (1:200 & 1:500)	567 -1029.0
17/11/81	Cyberdip (1:100)	566.0 -1029.0
	Geodip (1:20)	625-725, 910-1000

Refer to Appendix B4 for further details and interpretation of the logs.

A Velocity Survey and Synthetic seismogram were run by Seismic Services Limited (Enclosures 3 & 4).

Repeat Formation Tests (RFT's)

Fourteen RFT's were attempted in Baleen No.1: eight were pressure tests, the remainder were for sampling. No hydrocarbons were recovered, but a small amount of mud was recovered in three of the tests. Further details of the RFT's and a discussion of the results are presented in Appendix B4.

THE FORAMINIFERAL SEQUENCE

IN BALEEN #1

Fifty six samples from BALEEN #1 were examined for foraminiferal content although only fifty five side wall cores were examined (see footnote ¶). The following sequence was interpreted :-

Sidewall Cores Depth(m)	Approx. E-log Unit Boundary	Age	Zone*	Paleoenvironment
230.0 to 332.6		Pliocene to Mid Miocene	A to C	Inner Continental shelf (∿10-40m)
	Transitional			
353.7 to 435.2		Mid Miocene	D to E	Canyon Head (∿40m)
	Transitional			
458.0 to 538.0		Early Miocene	F to G	Mid shelf canyon (40-200m)
	Transitional			
551.7.0 to 597.0		Early Miocene	H-1	Shelf edge canyon (∿200m)
	Transitional			
612.0 to 627.0¶		Early Miocene	H	Upper slope fan (200-300m)
	∿∿∿627.0∿∿∿			
627.0¶ to 632.0		Oligocene	J	Inner shelf (10-40m)
	638.5			
640.0 to 651.0		Late Eocene	K	Estuarine entrance >10m
	657.0 to 662.0			
658.0 to 698.0		?	No plank. forams found	Deltaic/Estuarine
	base of sequence examined			

*Planktonic foraminiferal zonation after Taylor in prep.

¶SWC at 627 treated as two distinct samples as initial perusal showed two distinct lithologies, so it was split axially.

A list of side wall cores studied is shown on Tables I & 2. Planktonic foraminiferal content varied; being sporadic in the deltaic / estuarine sediments and consistantly diagnostic in the Early Miocene, but preservation precluded positive identification in some Mid Miocene samples from 458.0 to 332.6m.

Tables I & II (herein) detail the record summarised on page 1. A correlation diagram, Figure 1, is included, as is a micropaleontological data sheet, which shows the interpreted reliability of the planktonic zone determinations.

CORRELATION OF BALEEN #1 with ADJACENT WELLS and LAKES ENTRANCE

The fence diagram, Figure 1, demonstrates marked differences between Baleen and the other sequences in both biostratigraphic and approximate paleobathymetric correlations, in that: -

1) Oligocene sedimentation is poorly represented when compared with Flathead and the on shore sequence at Lakes Entrance. Thus the Oligocene hiatus, common to many Gippsland off shore sequences is indicated in Baleen. The Baleen hiatus represents a period of some 5 million years.

2) A paleodepth discrepancy is evident at the base of the Miocene (zone H) with Baleen sedimentation having occurred on the upper continental slope (estimated depths between 200 & 300m), whilst sedimentation in other sequences was on the inner continental shelf (approximately 40m). Structural adjustment during the late Oligocene was probably responsible for both the biostratigraphic hiatus and the paleobathymetric differences. Erosion was also evident with recycled Eo/Oligocene foraminifera being recorded in the basal Miocene samples in Baleen (refer Tables I & II). It is also noted that the Eo/Oligocene faunas in all sections, including Baleen, were of estuarine to inner shelf origin (∿0-40m).

3) There was a much higher accumulation rate in Baleen during the basal Miocene (Zone H) when compared with the other sections. These basal Miocene, proximal Carbonate turbidites, in Baleen, effectively filled the Oligocene depression created between 30 and 25 million years. Paleobathymetric equilibrium was achieved between sections (on Figure 1) by the Early/ Mid Miocene boundary (Zones F/E) at 15 million years.

NOTES and EXPLANATORY REFERENCES

1) LAKES ENTRANCE OIL SHAFT: Biostratigraphic sequence, shown on Figure 1, was adapted from Jenkins, D.G, 1960 - Planktonic foraminifera from the Lakes Entrance oil shaft, Victoria, Australia. *Micropaleontology, 6(4); 345-371.* Additional data below 367m and above 65m was gathered from wells and outcrop in immediate vicinity and is lodged in *Paltech* files.

2) PREVIOUS WELLS DRILLED ADJACENT TO BALEEN AND WHALE on VIC/P11. Data shown on Figure 1 regarding FLATHEAD #1 is from *Paltech* files. However GANNET #1 and ALBATROSS #1 were precluded from correlation because of poor quality data, as the only samples available and examined were ditch cuttings.

3) PALEOBATHYMETRIC INTERPRETATIONS were derived from the distribution of depth sensitive, benthonic foraminifera (listed on Table II) recorded in *Paltech* files with collaboration from:- HAYWARD, B.W. & BUZAS, M.A., 1979- Taxonomy and paleoecology of early Miocene benthic foraminifera of Northern New Zealand and the North Tasman Sea. *Smithsonian Contribs. to Paleobiology 36;* and references cited therein.

COMMENTS: * Interval from 469.0 to 366.0 can only be designated as E/D; being impossible to subdivide biostratigraphically due to poor preservation caused initially by canyon deposition & subsequent redistribution of carbonate and silica. This interval is represented by nine SWCs.

¶ SWC at 627 sampled across a disconformity between J-1 and H-2, thus sampling the widespread Gippsland late Oligocene hiatus. The higher sample contains a mixed fauna of recycled J with H-2.

CONFIDENCE RATING:

O:	SWC or Core	- Complete assemblage (very high confidence).
1:	SWC or Core	- Almost complete assemblage (high confidence).
2:	SWC or Core	- Close to zonule change but able to interpret (low confidence).
3:	Cuttings	- Complete assemblage (low confidence).
4:	Cuttings	- Incomplete assemblage, next to uninterpretable or SWC with depth suspicion (very low confidence).

NOTE: If an entry is given a 3 or 4 confidence rating, an alternative depth with a better confidence rating should be entered, if possible. If a sample cannot be assigned to one particular zone, then no entry should be made, unless a range of zones is given where the highest possible limit will appear in one zone and the lowest possible limit in another.

APPENDIX B2 PALYNOLOGY REPORT

BALEEN NO. 1 WELL

Palynological Examination and Kerogen Typing of Sidewall Cores

by

W.K. Harris

PALYNOLOGICAL REPORT

Client	:	Hudbay Oil (Australia) Ltd.
Study	:	Baleen No. 1 Well, Gippsland Basin.
Aims	:	Determination of age and distribution of kerogen types and spore colour.

INTRODUCTION

Thirty nine sidewall cores from Baleen No. 1 Well drilled in the Gippsland Basin at Lat. 38°0'36.63"S, Long. 148°28'8.4"E in Vic. P-11 were processed by normal palynological procedures.

The basis for the biostratigraphic and consequent age determinations are based on Stover and Partridge (1973) and Partridge (1976) for the Tertiary sediments and principally on Dettman (1963), Dettman and Playford (1969) with the modifications of Dettman and Douglas (1976) and Burger (1973) for the Early Cretaceous sequence.

OBSERVATIONS AND INTERPRETATION

A. Biostratigraphy

Table 1 summarises the biostratigraphy and age determinations for the samples studied. Tables II and III indicate the distribution of species encountered in the Early Cretaceous and Tertiary sequences respectively.

Several samples from this well are barren of plant microfossils and this is mostly due to unfavourable lithologies. These are dominated by light grey to white argillaceous sandstone and claystones generally representing oxidising environments of deposition.

Where plant microfossils have been recovered they are generally well preserved but assemblages were often not very diverse limiting the biostratigraphic precision.

1. Early Cretaceous 709 to 1014m

Assemblages from this section of the well were generally well preserved but many samples yielded only very sparse or poorly diversified assemblages. Between 878m and 1014.1m there is little diversity in the assemblages and ~~nothing in particular~~ that can be used for precise biostratigraphic assignment. The species recorded are consistent with an Early Cretaceous age but their range is often much greater.

An assemblage at 840.1m records the first appearance of Coptospora paradoxa marking the base of the zone of Coptospora paradoxa. The assemblages at this point became more diversified although low yields predominate. Between 745 and 795m yields are low and assemblages are poorly diversified. The Coptospora paradoxa asemblage reappears at 723m and the top of the Cretaceous section appears to still in this zone at 709m.

All of the Cretaceous assemblages are of non-marine aspect.

2. Eocene 640 to 698m

Although assemblages from this section of the well were well preserved the samples yielded in general very low quantities of organic matter with concomittant poor diversity.

Notwithstanding these features all assemblages can be assigned to the Nothofagidites asperus zone and some refinement can be made within this. Assemblages from 698 and 693m are certainly no older than Middle N. asperus zone but could be younger. The low diversity of Proteacidites spp. would tend to favour the younger age but with low diversity assemblages this assignment may be questioned. Dinoflagellates are uncommon in the sample at 698m but indicate some marine influence. Dinoflagellate assemblages become more diverse at 693m and the remainder of the samples to 640m have an increasingly stronger marine influence attesting to marine transgression in the Late Eocene.

The age of samples up to 658m is Late Eocene but their low yields and poor diversity precludes more precise biostratigraphic determination. The general appearance of the assemblages however would favour to younger assignment. From 651 - 640m the assemblages are more confidently assigned to the Late N. asperus zone from dinoflagellate evidence which includes the dominance of Spiniferites spp. and Areosphaeridium pectiniforme. The very common occurrence of dinoflagellates in these samples is indicative of open marine probably near shore sedimentation.

There would appear to be no significant breaks in the Eocene section of the well and the entire sequence was deposited under the influence of a late Eocene transgression.

B. Kerogen Types and Spore Colouration

During routine palynological processing of sidewall cores an unoxidised kerogen sample was taken and the nature of the kerogens and spore colouration are documented in Table V. Only those samples which yielded spore/pollen assemblages have been examined. Spore colour is expressed as the "Thermal Alteration Index" (TAI) of Staplin (1969) according to the scale in Table IV.

TABLE IV

Thermal - Alteration Index		Organic matter/spore colour
1 -	none	fresh, yellow
2 -	slight	brownish yellow
3 -	moderate	brown
4 -	strong	black
5 -	severe	black and evidence of rock metamorphism.

Total organic matter (TOM) is expressed semi-quantitatively in the scale-abundant, moderate, low, very low, barren. Samples classed as having abundant or moderate amounts of TOM would be expected to have TOC's (total organic content) greater than1%.

In this report four classes of organic matter are recognised - amorphogen, phyrogen, hylogen and melanogen and these terms are more or less synonymous with amorphous, herbaceous, woody and coaly. For reasons as outlined by Bujak et al. (1977) the former terms are preferred because they do not have a botanical connatation. The thermal alteration index scale follows that of Staplin (1969) and as outlined by Bujak et al. (1977). At a TAI of 2+ all four types of organic material contribute to hydrocarbon generation whereas at a TAI of 2, only amorphogenforms liquid hydrocarbons. The upper boundary defining the oil window is at a TAI ofapproximately 3 but varies according to the organic type. Above TAI 3+ all organic types only have a potential for thermally derived methane.

1. Cretaceous Section

Kerogen types throughout this unit are characterised by high melanogen with only one exception (e.g. 878m) where amorphogen becomes a significant component. If this section was mature for the genration of hydrocarbons if would yield dominantly gas with minor amounts of condensate.

Spore colour throughout is consistant at about 2 and cannot be considered to be mature especially when the kerogens are dominated by melanogen. These factors together with low to very low TOM values, imitigates against this section as a potential hydrocarbon source.

2. Tertiary Section - Eocene

This section is characterised by very low TOM's and the dominant kerogen type is amorphogen which appears as finely divided organic matter.

Where spore colour was determined it is indicative of immaturity.

All of the evidence suggests that this section in the early Tertiary is immature and does not contain sufficient organic matterof a favourable nature to be considered as a potential source rock for the generation of hydrocarbons.

Attention: Mr. J. W. Roestenburg

Subject: Combination Petrographic Studies
No. 1 Baleen Well
File Number: SCAL-308-81471

Gentlemen:

On December 1, 1981, seven core samples from the subject well were received by the Special Core Analysis Department of Core Laboratories, Inc., at Dallas, Texas, with a request by a representative of Core Laboratories International, Ltd., in Singapore for Combination Petrographic Studies. Damage in transit, however, permitted examination of only three of the samples. These examinations consisted of Petrographic Analysis by Thin Section, Mineral Content Determinations by X-ray Diffraction and Scanning Electron Microscope (SEM) observations. Results of these analyses are presented herein.

A portion of each of the submitted samples was prepared for thin section analysis and examined with a polarized light microscope. Thin section descriptions appear on Pages 1 through 3.

Additional portions of each of the samples were prepared for X-ray diffraction analyses. As requested, the whole rock and clay-sized (less than 4 microns in diameter) fractions were analyzed separately using monochromatic CuKα radiation. Results of these analyses appear on Page 4.

Another portion of each of the samples was prepared for SEM examination by creating freshly broken surfaces and coating these surfaces with a thin (750Å) film of gold-palladium. A discussion of the features observed by SEM appears on Pages 5 and 6.

Net clay values for the samples from 662 meters, 702 meters, and 705 meters were found to be 11.3 percent, 12.4 percent and 14.4 percent, respectively. Predominant among the clay minerals identified in each sample is kaolinite. Lesser amounts of illite clay were also identified in each sample. Production problems associated with these clays include a possible "mobile fines" reduction of permeability resulting from high flow rates, and a significant development of microporosity leading to high irreducible water saturations. Although a detrital matrix morphology is indicated in SEM photomicrographs, problems associated with these clay minerals should be minimized. Hydrochloric (HCl) acid or HCl/hydroflouric (HF) acid treatments could have a positive effect; however, the presence of iron-rich dolomite, siderite and pyrite in these samples requires the addition of an iron-chelating agent (e.g., citric acid) and an oxygen scavenger to inhibit formation damage by gelatinous ferric hydroxide. The significant content of montmorillonite identified in the sample from 662 meters reflects substantial contamination by drilling mud infiltrate, and does not pose a problem to production.

It has been a pleasure performing these analyses on behalf of Hudbay Oil, Ltd. (Australia). Should any questions arise, or if we can be of further assistance, please do not hesitate to contact us.

Very truly yours,

Core Laboratories, Inc.

Petrographic Analysis by Thin Section

Hudbay Oil, Ltd.
No. 1 Balleen Well

Depth, meters: 662

Very fine sandstone: quartz arenite

This sample is a moderately sorted, moderately packed quartz arenite. It consists of 73 percent quartz, 9 percent clay, 7 percent pyrite, 4 percent mica, 3 percent rock fragments, 2 percent goethite-limonite, and 2 percent organic material. Grain roundness varies from angular to subrounded while grain shapes vary from elongate to subequant and average 0.09mm in diameter. Grain contacts are tangential, planar, or concavo-convex.

Monocrystalline quartz exhibiting straight or undulose extinction is the major framework grain. Microlite inclusions of zircon and apatite are common in the quartz crystals. Minor vacuolization of quartz grains is also noted. Polycrystalline quartz with sutured subcrystal contacts and undulose extinction is rare. The lithic portion consists primarily of muscovite and biotite which are occasionally bent around framework grains. Microcrystalline chert grains are present in minor amounts. Glauconite pellets, although rare in occurrence, have been partially replaced by subhedral to euhedral pyrite. Clay clasts have also been replaced by pyrite. Pyroxene, zircon, collophane, glauconite, leucoxene, ilmonite, and apatite occur in trace amounts. Cementation is primarily by grain-coating and pore-filling detrital clays. Euhedral to subhedral and framboidal pyrite and goethite-limonite act as substantial pore-filling cements. Glauconite pellets and clay clasts have suffered the effects of post-depositional compaction and consequently are often deformed around stable framework grains. Hematite and microcrystalline quartz are minor cementing agents.

Primary intergranular porosity accounts for approximately 2 percent of this sample.

All percentages were obtained by point count.

Petrographic Analysis by Thin Section

Hudbay Oil, Ltd.
No. 1 Baleen Well

Depth, meters: 702

Fine sandstone: iron-rich quartz arenite

This sample is a moderately sorted, moderately packed iron-rich quartz arenite which consists of 37 percent quartz, 25 percent siderite, 25 percent goethite, 6 percent detrital clay, 3 percent feldspar, 2 percent organic material, and 2 percent mica. Grain roundness varies from angular to subrounded while grain shapes vary from elongate to subequant. Grain sizes average 0.12mm in diameter. Grain contacts are either tangential or planar.

The predominant framework grain, monocrystalline quartz, exhibits straight or undulose extinction and contains occasional microlitic inclusions of apatite and zircon. Muscovite and biotite often show evidence of post-depositional compaction and consequently are deformed around stable framework grains. Albite-twinned plagioclase represents the feldspar portion of this sample and alteration to sericite and clay is common. In addition, etching along cleavage traces is noted. Traces of hornblende, dolomite, hematite, and glauconite are present.

Cementation is primarily by equal amounts of siderite and goethite. Occasionally euhedral to subhedral siderite rhombs and geothite, which often replaces glauconite pellets, are present as pore-filling and grain-coating cements. Detrital clay is present as a grain-coating cement.

Primary intergranular porosity accounts for approximately 3 percent of this sample.

All percentages were obtained by point count.

Petrographic Analysis by Thin Section

Hudbay Oil, Ltd.
No. 1 Balleen Well

Depth, meters: 705

Coarse sandstone: slightly metamorphosed quartz wacke

This sample is a poorly sorted, loosely packed quartz wacke. It consists of 29 percent quartz framework grains, 50 percent sericitized polycrystalline quartz matrix, 16 percent clay, and 5 percent pyrite. Grain roundness varies from angular to subrounded while grain shapes vary from elongate to subequant. Grain sizes range from 0.2mm to 6.1mm in diameter. Grain contacts, although rare due to the high percentage of matrix material, are tangential or planar.

Monocrystalline quartz exhibiting strongly undulose extinction and containing occasional microlite inclusions of apatite and zircon is the predominant framework grain. Polycrystalline quartz grains with sutured subcrystalline contacts and strongly undulose extinction are not as abundant as monocrystalline quartz grains. Many of the quartz grains are stretched and aligned with respect to a common plane, a product of slight metamorphus. Pyroxene, zircon, ilmenite, leucoxene, and tourmaline are found in trace amounts.

Cementation is primarily by a matrix composed of sericitized polycrystalline quartz which appears to be encroaching upon quartz framework grains. This matrix accounts for the greatest loss in porosity of this sample. Detrital clay, detected by the overall "dirty" appearance of the matrix (in plane-polorized light) further reduces porosity. Isolated patches of large (up to 1.7mm), skeletal pyrite crystals have partially replaced framework grains and also serve as a minor cement.

Primary intergranular porosity, due to the abundance of matrix material, is less than 1 percent.

All percentages were obtained by point count.

Scanning Electron Microscope Study

Hudbay Oil, Ltd.
No. 1 Balleen Well

Depth, meters: 662

The sample from 662 meters is a dark gray, loosely consolidated, very fine grain sandstone. Photomicrograph A1(100X) shows a moderately packed aggregate of very fine sand and silt grains cemented by siderite and a matrix of detrital clay. Primary intergranular porosity, viewed in photomicrographs B1(600X) and C1(700X), has been reduced by the cements such that only microporosity associated with the matrix material is significant. A more detailed examination of the matrix material, provided by photomicrographs B2(3000X) and C2(3500X), reveals a poorly defined morphology which suggests a primarily detrital origin. In addition, photomicrograph B1(600X) shows framboidal pyrite.

Depth, meters: 702

The sample from 702 meters is a brown, loosely consolidated, very fine grain sandstone. Photomicrograph A1(100X) shows a moderately packed aggregate of very fine sand and silt grains cemented by a matrix of detrital clay, crystalline siderite and minor amounts of dolomite. Although the cements have greatly reduced primary intergranular porosity, photomicrographs B1(600X) and C1(700X) suggest significant microporosity associated with the matrix material. Photomicrographs B2(3000X) and C2(3500X) provide a more detailed examination of the matrix material, revealing the poorly defined morphology of detrital clay. In addition, finely crystalline rhombohedrons of dolomite are also present.

Scanning Electron Microscope Study

Hudbay Oil, Ltd.
No. 1 Balleen Well

Depth, meters: 705

The sample from 705 meters is a light gray, loosely consolidated, very fine grain sandstone. Photomicrograph A1(100X) shows a moderately packed aggregate of very fine sand and silt grains cemented by a detrital clay matrix and minor amounts of siderite. Primary intergranular porosity, viewed in photomicrographs B1(700X) and C1(800X), has been reduced such that only microporosity associated with the matrix material is significant. Photomicrographs B2(3500X) and C2(4000X) provide a more detailed view of the matrix material and reveal a poorly defined morphology suggesting a primarily detrital origin.

Woodlands 6018
16 December,1981.

Dear Greg,

Baleen # 1; Side Wall Cores

enclosed herein are the lithological descriptions of the side wall cores from Baleen # 1 as requested in your letter of November 27. The samples are of unconsolidated sand but because of the tight packing of grains and crystals there is virtually no intergranular pore space to be measured.We have not pursued the identity of the clays or carbonate by X-ray diffraction since this would involve a lengthy investigation that seems unwarranted in the circumstances.

Invoices for this work are enclosed.

Yours sincerely,

R G Brown B. W. Logan

BALEEN No.1 - LOG OF SAMPLES

Description of Cuttings Samples

All depths quoted are below the Rotary Table, which is 9.45 metres above Mean Spring Low Water and 64.35 metres above the sea floor.

Colours are taken from the Geological Society of America's "Rock Colour Chart". Samples were collected from the base of the 20 inch casing shoe at 209 metres R.T. to Total Depth at 1030 metres.

225 - 295 metres (70 metres)	Calcarenite, skeletal, glauconitic below 280 m, white to dark yellow orange to olive grey, very fine to granular, dominantly fine (forams) and granular (skeletal fragments), poorly sorted, angular to rounded, 15-30% calcite silt, 10-25% micrite, trace-5% clay minerals, trace-5% glauconite, 0-trace pyrite, unconsolidated to moderately hard, fair to very good intergranular porosity, trace intraskeletal porosity.
295 - 500 metres (205 metres)	Calcarenite, skeletal, light grey to medium dark grey, very fine to granular, dominantly granular and very coarse, poorly sorted, angular to rounded, 10-30% calcite silt, trace-25% micrite, 0-10% clay minerals, trace quartz silt, trace quartz grains, trace glauconite, 0-trace pyrite, 0-trace chlorite, unconsolidated to soft, fair to very good intergranular porosity.
500 - 577 metres (77 metres)	Calcisiltite, skeletal, light grey to dark grey to dark greenish grey, 15-45% skeletal fragments (decreasing with depth), very fine to granular, dominantly medium, poorly sorted, angular to rounded, 5-15% micrite, 5-10% clay minerals, trace-5% calcite cement, trace pyrite, 0-trace glauconite, 0-trace chlorite, soft to moderately hard, nil to poor intergranular porosity. Interbedded with 5-35% Claystone, medium dark grey to olive black, 10-15% micrite, 5-20% calcite silt,

	0-5% skeletal fragments, trace pyrite, moderately hard, nil porosity.
577 - 635 metres (58 metres)	Claystone, calcareous, light green grey to olive black, 5-30% skeletal fragments (fine to granular, dominantly coarse, poorly to moderately sorted), 15-20% calcite silt, 5-15% micrite, trace-5% glauconite, trace pyrite, trace chlorite, soft to moderately hard. With 5-65% (maximum between 590-605m) Calcisiltite, skeletal, light green grey to medium greenish grey, 25-30% skeletal fragments (dominantly coarse, moderately sorted), 5-10% micrite, 5-15% clay minerals, soft to moderately hard, trace intergranular porosity.
635 - 690 metres (55 metres)	Claystone, glauconitic, calcisiltitic in part, light green grey to greyish olive, 10-40% glauconite, limonitic in part, 5% skeletal fragments, 15-20% calcite silt, 5-10% micrite, trace pyrite, trace chlorite, very soft to soft. With 10-35% Sandstone, silty in part, glauconitic, clear to light grey to greyish brown, very fine to medium grained, dominantly very fine and fine (size increasing with depth), subangular to subrounded, moderately sorted, 15-25% quartz silt, 10-15% glauconite, trace-10% dolomite, soft to hard, trace-10% intergranular porosity. And below 660 m, trace-5% Sandstone, clear to white to light grey, coarse to granular, dominantly very coarse, subangular to rounded, well sorted, unconsolidated. Note: glauconite oxidised to limonite granules below below 645 m.
690 - 700 metres (10 metres)	Claystone, glauconitic, as between 635-690 m.

With 30-40% Sandstone, glauconitic, clear to greyish brown, very fine to medium, dominantly medium, subangular to subrounded, moderately sorted, 10% quartz silt, 10% glauconite, 5% dolomite, soft to moderately hard, 5-10% intergranular porosity.

And 20-40% Sandstone, coarse to granular as between 660-690 m.

(percentage of claystone and fine sandstone decreasing; coarse, unconsolidated sand increasing from 690-700m).

700 - 705 metres
(5 metres)

Sandstone, coarse to granular, as between 660-690m.

With 15% Claystone, glauconitic, as between 635-690m.

705 - 730 metres
(25 metres)

Sandstone, clear to white to light grey, very fine to granular, dominantly very coarse (at 705m) decreasing to dominantly medium below 715 m, subangular to rounded, poorly to moderately sorted, 5% glauconite, trace pyrite, 0-trace calcite cement, unconsolidated, very good porosity

With (below 710 m), 20-35% Siltstone, argillaceous in part, dark grey to greenish grey to medium bluish grey, 15-20% clay minerals, trace-10% pyrite, 0-5% chlorite, hard to very hard.

730 - 830 metres
(100 metres)

Sandstone, argillaceous in part, clear to white to light grey, very fine to granular, dominantly medium, subangular to subrounded, poorly to moderately sorted, 5-25% kaolin-type clay minerals below 765 m, trace-5% glauconite, trace pyrite, trace skeletal fragments, 0-trace calcite cement, trace carbonaceous material (below 740m), unconsolidated to very soft, poor to very good intergranular porosity.

With 30-45% Siltstone, argillaceous in part, as between 705-730m.

And below 740m, 5-30% Claystone, skeletal in part, olive grey to dark grey to dark green grey, 10-20% skeletal fragments, trace-10% quartz silt, trace pyrite, trace chlorite, trace brown mica (very coarse biotite flakes).

And below 760m, 15-40% Siltstone, arenaceous, light brown to light grey, 35-45% quartz grains, (very fine to fine, dominantly very fine), trace brown mica (very coarse flakes), 5-15% clay minerals, trace pyrite, very soft to soft, trace porosity.

And between 760-780m, and 815-825m, 5-20% Coal, brownish black, soft to moderately hard.

830 - 880 metres
(50 metres)

Sandstone, argillaceous in part, clear to white to light grey to light brown, very fine to granular, dominantly medium, subangular to rounded, poorly to moderately sorted, 5-20% "white" clay minerals (? kaolin), 10-15% quartz silt, trace glauconite, trace pyrite, trace skeletal fragments, trace carbonaceous material and (below 855 m) trace lithic fragments, fair to very good intergranular porosity.

With 30-45% Siltstone, dark grey to greenish grey to brown to orange pink, 10-15% clay minerals, trace-5% pyrite, trace chlorite, moderately hard to hard.

And trace-15% Claystone, as between 730-830m.

And above 740m, 10-15% Siltstone, arenaceous, as between 730-830m.

880 - 925 metres
(45 metres)

Sandstone, argillaceous in part, generally as between 830-880m, with trace feldspar.

With 30-45% Siltstone, as between 830-880m.

And 0-5% increasing to 25% at 925m Claystone, olive grey to dark grey to dark green grey, trace-10% skeletal fragments, very fine to fine, trace-15% quartz silt, trace of pyrite, chlorite and brown mica, soft.

925 - 955 metres
(30 metres)

Sandstone, argillaceous in part, between 880-925m, with trace lithic fragments below 930 m, trace to poor porosity.

With 20-40% Siltstone as between 830-880m.

And 5-40% (dominant between 930-935m) Coal, black, vitreous, high rank at 935m.

And 15-50% (dominant between 940-945m) Claystone, silty in part, as between 880-925m.

955 - 1030 metres
(75 metres)

Sandstone, argillaceous in part, clear to white to light grey to orange, very fine to granular, dominantly medium, subangular to rounded, 10-20% white clay minerals (? kaolin), trace-10% quartz silt, trace glauconite, trace pyrite, trace skeletal fragments, 0-trace carbonaceous material, trace feldspar, rare trace lithic fragments, unconsoldiated to very soft (see note below), fair to good intergranular porosity.

With 30-45% Siltstone, as between 830-880m.

And nil-20% Claystone, silty in part as between 880-925m.

Also nil-20% Coal, as between 925-955m.

NOTE: Below 900 m, cuttings show unconsolidated quartz and siltstone pieces (plus minor claystone and coal), with very little white clay. However chips taken from top shaker show more clay matrix (20% ± ?) and vary from very soft, when wet, to moderately hard or friable when dry. Hence porosity is thought to be much less than indicated from study of cuttings samples.

APPENDIX B6 GEOCHEMICAL ANALYSES

GEOCHEMICAL ANALYSIS OF GAS SAMPLES A-8526 AND A-11939 FROM BALEEN #1

RESULTS

RESULTS

COMPOSITIONAL ANALYSIS

Component	A-11939 (by volume)	A-8526 (by volume)
Methane	95.8%	95.6%
Ethane	0.16%	0.13%
Propane	8ppm	11ppm
Butanes	3ppm	7ppm
Pentanes	2ppm	2ppm
Carbon Dioxide	0.02%	0.02%
Nitrogen	4.00%	4.20%

ISOTOPE ANALYSIS

Sample	$\delta^{13}C$ (PDB)
A-8526	$-49.8^{o}/oo$
A-11939	$-45.3^{o}/oo$

COMMENTS AND CONCLUSIONS

COMMENTS AND CONCLUSIONS

GENERAL

Two cylinders (#A-8526 and #A-11939) of gas from the Baleen #1 exploration well were provided for geochemical analysis. Firstly, the C_1-C_5 hydrocarbon composition of each gas was determined by gas chromatography using a Chromosorb 102 column and a flame ionization detector (FID). Secondly, the relative proportions of nitrogen, carbon dioxide and ethane in the samples was determined by gas chromatography using a Chromosorb 102 column and a thermal conductivity detector (TCD). Since the proportion of ethane was measured in both analyses and the relative detector responses of all of the analysed gases is known the relative proportion by volume of each of the components was able to be calculated. Finally, the stable carbon isotope ratio of each of the gases was measured using an MS-20 stable isotope mass spectrometer.

We have reason to believe that the determination of the proportion of methane in dry gases such as these Baleen samples is most accurately carried out using a TCD detector rather than an FID detector. Unfortunately, at the time of these analyses we did not have a column suitable for this type of analysis but we are in the process of rectifying this problem for future analyses.

GAS COMPOSITION

The compositional analysis data clearly shows that the two gases are similar in composition and further that they are very dry and contain a moderately high proportion of nitrogen.

CARBON ISOTOPE COMPOSITION

It is now well-established that the following carbon isotope criteria can often be used to characterize the source of natural gas:

Carbon Isotope Values	Gas Source
-75 to -58°/oo	dry bacterial methane
-58 to -40°/oo	gas associated with oil
-40 to -25°/oo	deep, dry thermal gas

Thus, the isotope ratios for the Baleen #1 gases are typical of gas associated with oil generation. However, this type of gas usually has an abundant C_2+ component whereas the Baleen gas has a very small C_2+ fraction. Therefore to explain the isotope ratio and the hydrocarbon composition of Baleen gas it is necessary to suggest that this gas is a mixture of dry bacterial methane and dry thermal gas.

It should be noted that more tenuous explanations such as migration effects could account for the observed hydrocarbon and isotopic composition of these gas samples.

SPECIAL TEST REPORT

Requested by Hudbay Oil (Aust.) Pty. Ltd. Sample Book No. 811179

Date Received 11th December, 1981

Material Natural Gas Job No. 248

Query Analysis on Baleen No 1 Report No. 81/786/AN

Origin of Sample Sampling bottles Serial Nos. A11954 (DST #2), A11977 (DST #1)

REPORT

<u>ANALYSIS OF SAMPLING BOTTLE SERIAL NO. A11954.</u>

COMPONENTS	MOLAR CONCENTRATION
Methane	97.9 ± 0.2 percent
Ethane	0.10 ± 0.01 percent
Propane	14 ± 2 ppm
iso Butane	5 ± 2 ppm
normal Butane	less than 2 ppm
neo Pentane	11 ± 2 ppm
iso Pentane	less than 2 ppm
normal Pentane	less than 2 ppm
Heavier Hydrocarbons	96 ± 4 ppm
Oxygen plus Argon	0.04 ± 0.01 percent
Nitrogen	1.87 ± 0.02 percent
Carbon Dioxide	0.13 ± 0.01 percent
Helium	30 ± 10 ppm

A sulphur compound boiling in the range 120 - 160°C (carbon disulphide, ethyl mercaptan or dimethyl sulphide) was found to be present at < 0.2 mgm/m^3 as sulphur. Hydrogen sulphide was not detected (detection limit 5 ppm).

A second sample, sampling bottle Serial No.A11977, was found to be at atmospheric pressure. An oxygen analysis of 7.1 percent indicated air contamination. Lack of sample pressure prevented further analysis.

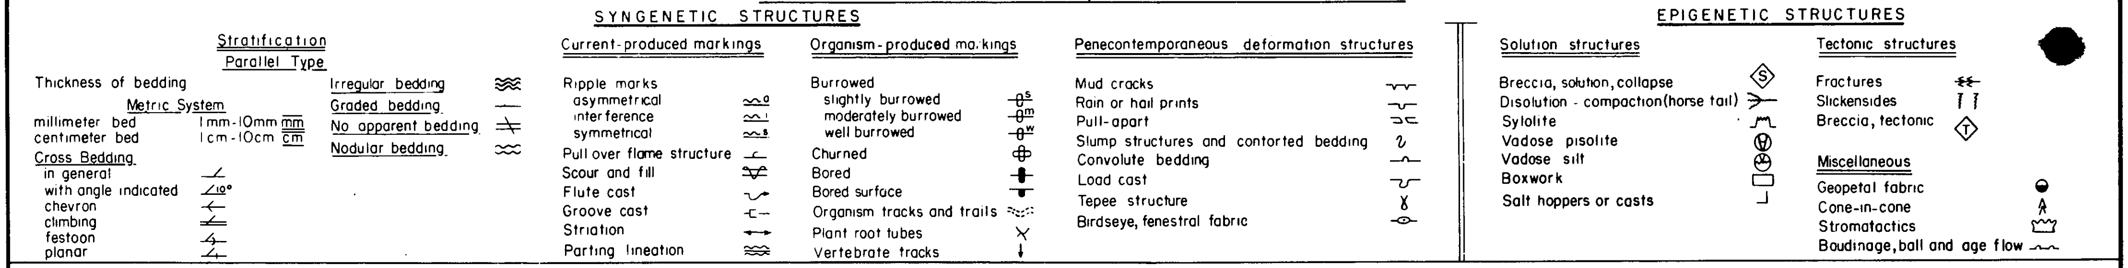
STRUCTURES (STRATIFICATION, SEDIMENTARY, DIAGENETIC)



SYNGENETIC STRUCTURES

Stratification
Parallel Type

Thickness of bedding
Metric System
millimeter bed 1mm-10mm mm
centimeter bed 1cm-10cm cm
Cross Bedding
- in general ∠
- with angle indicated ∠10°
- chevron
- climbing
- festoon
- planar

Irregular bedding ≋
Graded bedding —
No apparent bedding ≠
Nodular bedding

Current-produced markings
- Ripple marks
  - asymmetrical
  - interference
  - symmetrical
- Pull over flame structure
- Scour and fill
- Flute cast
- Groove cast
- Striation
- Parting lineation

Organism-produced markings
- Burrowed
  - slightly burrowed
  - moderately burrowed
  - well burrowed
- Churned
- Bored
- Bored surface
- Organism tracks and trails
- Plant root tubes
- Vertebrate tracks

Penecontemporaneous deformation structures
- Mud cracks
- Rain or hail prints
- Pull-apart
- Slump structures and contorted bedding
- Convolute bedding
- Load cast
- Tepee structure
- Birdseye, fenestral fabric

EPIGENETIC STRUCTURES

Solution structures
- Breccia, solution, collapse
- Disolution - compaction (horse tail)
- Sylolite
- Vadose pisolite
- Vadose silt
- Boxwork
- Salt hoppers or casts

Tectonic structures
- Fractures
- Slickensides
- Breccia, tectonic

Miscellaneous
- Geopetal fabric
- Cone-in-cone
- Stromatactics
- Boudinage, ball and age flow

Abbreviations

GRAIN SIZE
- VF Very Fine
- F Fine
- M Medium
- C Course
- VC Very Coarse
- G Granule & larger

CEMENT
- Q Silica
- Py Pyrite
- C Calcite
- D Dolomite
- Sd Siderite

DIAGENESIS
- D Dolomitization
- Q Silicification
- X Recrystallization
- Ce Chloritization

ROUNDING
- R Rounded
- SR Subrounded
- SA Subangular
- A Angular

SORTING
- P Poor
- M Moderate
- W Well
- VW Very Well

HARDNESS
- U Unconsolidated
- VS Very Soft
- S Soft
- M Moderate
- H Hard

POROSITY
- g Intergranular
- v Vugular
- i Intraskeletal

ACCESSORIES
- Py Pyrite
- Mc Mica
- Ch Chert
- Cc Lignite/Coal
- Hm Heavy minerals
- Lf Lithic fragments
- Gl Glauconite

DIAGENETIC TEXTURES
- CX Crypto <1/256mm
- MX Micro 1/256 - 1/16mm

HYDROCARBONS
- * Signifies presence
- Full details described under supplementary data

Baleen #1; 683.0 m

As for Baleen #1; 688.0 m; somewhat more micaceous and less calcareous.

Baleen #1; 678.0 m

Brown, unconsolidated, very fine grained, micaceous quartz sand; mottled with 0.2 mm to 2 mm patches and wisps that are more micaceous and possibly also contain plant fibre. Components; detrital quartz, 0.05 to 0.1 mm angular to very angular grains, 70%; mica flakes, tabular, 0.05 to 0.1 mm, 20%; glauconite grains, 0.05 mm, green, 5%; (?) authigenic feldspar, 2%. All grains are tightly packed with embayed and distorted mica flakes occupying interareas in a framework of quartz, so that there is no effective intergranular void space.

Baleen #1; 659.0 m

Brown, unconsolidated, micaceous, glauconitic quartz sand and sideritic carbonate. The sample consists of a patchy mosaic of these two lithotypes. The quartz sand is fine- to medium-grained, with 0.1 to 1 mm glauconite pellets and mica flakes in tightly packed arrays. Euhedral rhomboid siderite crystals 0.1 mm, form tightly packed aggregates.

Baleen #1; 693.0m

Brown, unconsolidated,very fine grained, calcareous, glauconitic and micaceous, quartz sand. Components: detrital quartz grains, angular to very angular, 0.05 to 0.1 mm, 60 to 70%; mica, red-brown, 0.05 to 0.1 mm flakes, 10 to 20%; glauconite pellets, green-brown to brown, rounded to ovoid bodies, 0.1 to 0.3 mm diam., 10 to 15%; feldspar, euhedral grains, 0.05 to 0.1 mm, 5 to 10%; calcite crystals, poikilotopic, 0.1 mm, 5%. All grains and crystals are tightly packed with embayed and distorted mica, glauconite and carbonate occupying interareas between detrital quartz grains, so that there is no intergranular void space. Quartz to quartz contacts are usually lined with thin mica plates, so that interlocking growth is prevented. Feldspar (? albite) appears to be authigenic growing from carbonate and mica.

Baleen #1; 688.0 m

Brown, fine- to very fine grained, micaceous, glauconitic and calcareous, quartz sand. Components: detrital quartz, 0.08 to 0.1 mm angular to very angular grains, 50%; glauconitic pellets, brown to black, 0.1 to 0.3 mm ovoid to rounded blebs, 20 to 30%; mica flakes 10%; ferroan calcite crystals 0.01 to 0.1 mm. All grains and crystals are tightly packed with embayed and distorted mica and glauconite occupying interareas between detrital quartz grains. Carbonate material also occupies intergranular space and occurs as crystal aggregates 0.1 to 0.5 mm in size.

PE601371

This is an enclosure indicator page.
The enclosure PE601371 is enclosed within the container PE902682 at this location in this document.

The enclosure PE601371 has the following characteristics:

ITEM_BARCODE = PE601371
CONTAINER_BARCODE = PE902682
NAME = Airgun Well Velocity Survey & Calibrated Log Data
BASIN = GIPPSLAND
PERMIT =
TYPE = WELL
SUBTYPE = VELOCITY_CHART
DESCRIPTION = Airgun Well Velocity Survey & Calibrated Log Data
REMARKS =
DATE_CREATED = 17/11/1981
DATE_RECEIVED = 13/09/1982
W_NO = W759
WELL_NAME = Baleen-1
CONTRACTOR = Seismograph Service (England) Ltd.
CLIENT_OP_CO = Hudbay Oil Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE601372

This is an enclosure indicator page.
The enclosure PE601372 is enclosed within the
container PE902682 at this location in this
document.

The enclosure PE601372 has the following characteristics:

ITEM_BARCODE = PE601372
CONTAINER_BARCODE = PE902682
NAME = Wellsite Lithology Log
BASIN = GIPPSLAND
PERMIT =
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Wellsite Lithology Log (enclosure 5 of WCR) for Baleen-1
REMARKS =
DATE_CREATED = 30/11/1981
DATE_RECEIVED = 13/09/1982
W_NO = W759
WELL_NAME = Baleen-1
CONTRACTOR = Hudbay Oil Ltd
CLIENT_OP_CO = Hudbay Oil Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE601373

This is an enclosure indicator page.
The enclosure PE601373 is enclosed within the container PE902682 at this location in this document.

The enclosure PE601373 has the following characteristics:
ITEM_BARCODE = PE601373
CONTAINER_BARCODE = PE902682
NAME = Velocity Log Linear Time Scale
BASIN = GIPPSLAND
PERMIT =
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Velocity Log Linear Time Scale (enclosure 4 of WCR) for Baleen-1
REMARKS =
DATE_CREATED = 09/11/1981
DATE_RECEIVED = 13/09/1982
W_NO = W759
WELL_NAME = Baleen-1
CONTRACTOR = SEISMOGRAPH SERVICE (ENGLAND) LTD.
CLIENT_OP_CO = Hudbay Oil Ltd

PE601374

This is an enclosure indicator page.
The enclosure PE601374 is enclosed within the container PE902682 at this location in this document.

The enclosure PE601374 has the following characteristics:

ITEM_BARCODE = PE601374
CONTAINER_BARCODE = PE902682
NAME = Composite Well Log
BASIN = GIPPSLAND
PERMIT =
TYPE = WELL
SUBTYPE = COMPOSITE_LOG
DESCRIPTION = Composite Well Log (enclosure 1 of WCR) for Baleen-1
REMARKS =
DATE_CREATED = 30/11/1981
DATE_RECEIVED = 13/09/1982
W_NO = W759
WELL_NAME = Baleen-1
CONTRACTOR = Hudbay Oil Ltd
CLIENT_OP_CO = Hudbay Oil Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE601375

This is an enclosure indicator page.
The enclosure PE601375 is enclosed within the container PE902682 at this location in this document.

The enclosure PE601375 has the following characteristics:

ITEM_BARCODE = PE601375
CONTAINER_BARCODE = PE902682
NAME = Exlog Formation Evaluation Log (Mud Log)
BASIN = GIPPSLAND
PERMIT =
TYPE = WELL
SUBTYPE = MUD_LOG
DESCRIPTION = Exlog Formation Evaluation Log (Mud Log --enclosure 6 of WCR) for Baleen-1
REMARKS =
DATE_CREATED = 16/11/1981
DATE_RECEIVED = 13/09/1982
W_NO = W759
WELL_NAME = Baleen-1
CONTRACTOR = EXLOG
CLIENT_OP_CO = Hudbay Oil Ltd

(Inserted by DNRE - Vic Govt Mines Dept)

PE902683

This is an enclosure indicator page.
The enclosure PE902683 is enclosed within the container PE902682 at this location in this document.

The enclosure PE902683 has the following characteristics:

ITEM_BARCODE = PE902683
CONTAINER_BARCODE = PE902682
NAME = Geophysical Time Map Near Top Latrobe Horizon
BASIN = GIPPSLAND
PERMIT =
TYPE = SEISMIC
SUBTYPE = HRZN_CONTR_MAP
DESCRIPTION = Geophysical Time Map Near Top Latrobe Horizon (Enclosure 2 of WCR) for Baleen-1
REMARKS =
