

2-98 Anemone 1A

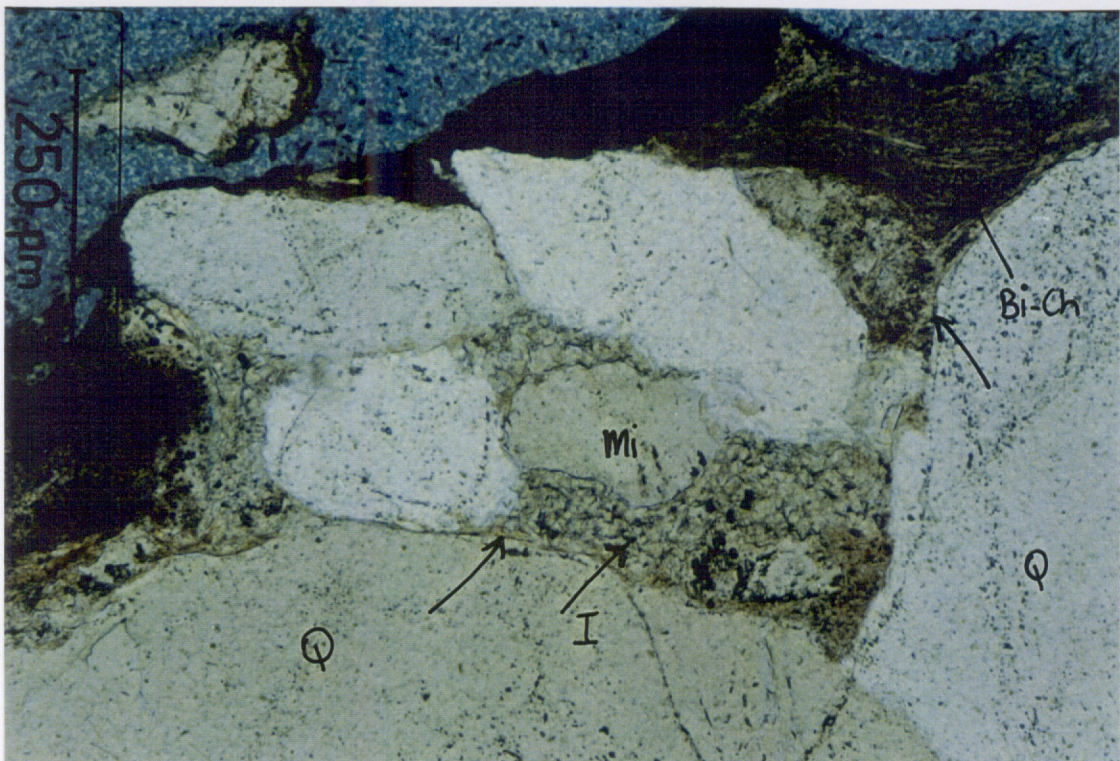

Figure 17 - Anemone #1A, cuttings, 4545 - 50m. (Plane polarized light). Detail of a composite grain from this sample shows quartz (Q) filled with vacuole trails. There are minor quartz overgrowths on some grains (arrowed). A biotite grain is partly altered to chlorite (Bi-Ch). A ragged edged microcline grain (Mi) is dusty from minor sericite alteration and shows dissolution around the grains. Any primary porosity is now filled with clays. The dark edge to the whole chip is drilling mud.
