WELL CLASSIFICATION: **Appraisal**  The Atwood Falcon arrived at the Blackback 2 location at 19:00 hours on September 15th 1992. The MV Lady Caroline and the MV Maersk Lifter ran and set anchors 3 and 7 before the rig was ballasted to survival draft to wait on weather. The Maersk Lifter resumed running the remaining anchors at 06:30 hours on September 17th. The final anchor was set at 23:30 hours on September 17th and the rig was ballasted down to a 55 foot drilling draft. The final location was 13 metres on a true bearing of 104 degrees from the called location in a water depth of 370.38 metres.

### a) 36" HOLE SECTION

The TGB running tool and bumper sub were picked and the TGB tripped to the seabed. After the TGB was set, the TGB running tool was released, tripped out and layed down. MWD was picked up and TIH with a 17.5" drilling assembly. The MWD was tested prior to stabbing into the TGB and monitoring with the ROV. The ROV was then removed and a survey taken with MWD which indicated a 0.88 degree deviation. Blackback 2 was spudded at 19:15 hours on September 18th. The pilot hole was drilled from 392.63 to 433 metres, sweeping the hole with high viscosity pills as needed and reaming each joint drilled. A survey was taken at 433 metres and indicated a 1.1 degree deviation. The hole was then swept with a 50 barrel pill before pulling out the 17.5" drilling assembly. A bottom hole assembly consisting of a 17.5" bit, a 26" hole opener, a 36" hole opener and MWD was made up. The MWD was downloaded and initialsed before running in the hole. The 17.5" hole was opened to 36" from 392.6 to 427 metres. The hole was then swept with a high viscosity pill before making a wiper trip to within 5 metres of the seabed. The bottom hole assembly was pulled out of the hole and the hole displaced with 205 barrels of gel mud. The permanent guide base and 30" casing were then picked up and run. The 30" casing shoe was set at 427 metres and the casing cemented with 500 sacks of class 'G' cement mixed with 2% CaCl2 and 60 barrels of water, at a slurry density of 15.8 ppg. The 36" drilling assembly was then picked and layed out and a 26" bit made up and run in the hole. The top of cement was tagged at 420 metres and cement drilled from 420 to 430 metres. The hole was then wiped, reamed and flushed with a 75 barrel high viscosity pill before pulling out with the 26" bit.

### b) <u>17 1/2" HOLE SECTION</u>

A new 17 1/2" bit was picked up and run in the hole to 430 metres. The 17 1/2" hole was drilled from 430 to 1168 metres and swept with high viscosity pills as needed. The hole was then swept with a 100 barrel high viscosity pill and a survey dropped. The bottom hole assembly was then pulled out to the 30" casing shoe and the survey recovered, indicating 0.25 degrees of deviation. The bit was run back in the hole to 1149 metres and the hole washed from 1149 to 1168 metres. The hole was swept with another 100 barrel high viscosity pill and a spot 600 barrel high viscosity pill before again pulling out to the 30" casing shoe. A spot 120 barrel high viscosity pill was pumped at the 30" casing shoe before pulling out of the hole and rigging up to run casing. A total of 53 joints of 54.5 lb/ft K55 and 10 joints of 68 lb/ft K55 13 3/8" casing were run, along with a 13 3/8" X 20" swedge and one joint of 133 lb/ft 20" casing. The 13 3/8" casing shoe landed at 1152.61 meters. The casing was cemented with a lead slurry of 1500 sacks of class 'G' cement mixed with 430 barrels of water and 3.1% PH gel to a density of 12.5 ppg. A tail slurry of 670 sacks of class 'G' cement in 80 bbls of seawater was then pumped at a slurry density of 15.8 ppg. The BOP was rigged up and run on 21" x 5/8" wall thickness Vetco riser. The BOP was latched to the 18 3/4" wellhead and pull tested to 50 kips overpull. The connector was pressure tested (300/1500 psi) and the

choke and kill lines tested to 200/5000 psi every five joints. The slip joint was scoped out and the diverter installed. The shear rams, well head connection and casing string were then tested to 1500 psi. The 17 1/2" drilling assembly was layed out and the BOP/riser running gear removed from the rig floor.

### c) <u>12 1/4" HOLE SECTION</u>

A 12 1/4" bottom hole assembly consisting of a 12 1/4" PDC (DS40H) bit, 9 5/8" mud motor and MWD was made up and run in the hole to 711 metres, where the mud motor and MWD were tested. The bottom hole assembly was then run to the top of cement at 1124 metres. The cement and shoe were drilled out and the rat hole cleaned out. 12 1/4" hole was drilled from 1168 to 1171 meters, where a high viscosity slug was pumped and bottoms up circulated. The phase-2 PIT was then performed to a maximum of 950 psi (13.0 ppg equivalent). The 12 1/4" hole was then drilled using the mud motor and MWD from 1171 to 2767 metres, with the riser flushed at 1513, 1831, 2090, 2375 and 2577 metres. Samples were circulated at 2768 and at 2778 meters prior to pulling out with the bottom hole assembly to cut core # 1. A new 9 5/8" RC412 Coreguard bit was made up on an 8" X 5 1/4" barrell and run in the hole to cut core # 1. The hole was washed and reamed from 2761 to 2778 metres and bottoms up circulated before cutting the core. Core #1 was cut from 2778 to 2780 metres. The core bit was pulled out of the hole due to an extremely slow penetration rate. No core was recovered. A new Reed HP51AJ bit was made up with a junk sub and MWD and run in the hole to drill ahead. The 12 1/4" hole was drilled from 2780 to 2790 metres before circulating bottoms up. As no shows were recorded, drilling continued from 2790 to 2797 metres, where a drilling break was flow checked and bottoms up circulated. The bottom hole assembly was pulled out of the hole. A 9 7/8" RC412 coreguard bit was made up on an 18 metre core barrel and run in the hole to cut core #2. Bottoms up were circulated prior to cutting core #2 from 2797 to 2814 metres. The core barrel was then pulled out of the hole and 16.5 metres of core (97%) recovered. The core barrell was then serviced and made up with a rerun RC412 coreguard bit. The coring assembly was run in the hole and core #3 cut 2814 to 2831 metres. The core barrel was pulled out of the hole and 16.4 metres of core (96%) recovered. The weekly BOP pressure testing program was conducted before making up a 12 1/4" drilling assembly. The 12 1/4" drilling assembly was run in the hole and the cored section opened from 9 7/8" to 12 1/4" from 2801 to 2831 metres while logging with MWD. The 12 1/4" hole was then drilled from 2831 to 2832 metres before circulating bottoms up and pulling out of the hole to continue coring. The core barrel was dressed and made up with a rerun 9 7/8" Coreguard RC 412 bit. The coring assembly was run in the hole and core #4 cut from 2832 to 2850.5 metres. The coring assembly was pulled out of the hole and 18.5 meters (100%) of core recovered. The core barrel and stabilizers were serviced and run in the hole to cut core # 5 from 2850.5 to 2869 metres. The coring assembly was then pulled out of the hole and 18.5 metres of core (100%) recovered. The coring equipment was then layed down. A 12 1/4" drilling assembly was made up with MWD and run in the hole to 2799 metres. The hole was washed and reamed from 2799 to 2832 metres. The cored section was then reamed from 9 7/8" to 12 1/4" from 2832 to 2869 metres before drilling ahead. TD was called at a depth of 3160 metres at 06:00 hours on the 4th of October 1992. A slug was pumped prior to pulling back to 3096 metres. The hole was back reamed from 3096 to 2827 metres, where another slug was pumped. The bit was then pulled out to 1150 metres before breaking the collar from the 9 5/8" casing hanger and rigging down the Sperry-Sun heave indicator. The bit was then run back to 3142 metres and the hole washed from 3142 to 3160 metres. An 80 barrel high viscosity slug was pumped and bottoms up circulated. A further slug was pumped before pulling out to 2856 metres, with back reaming between 3160 and 2885 metres. The bit was again run to 3142 and the hole washed to TD. A 60 barrel high viscosity pill was pumped and bottoms up circulated. The riser was flushed before pulling out of the hole,

with precautionary back reaming between 3160 and 2971 metres. The MWD was downloaded and layed down before rigging up Schlumberger.

Schlumberger were rigged up to run suite 1 logs. DLL-MSFL-SDL-SP-GR-AMS was run first, followed by FMS-LDL-CNL-NGS-AMS and MDT-GR-AMS (pretests, vertical/horizontal permeability tests and samples). Two CSAT tools were then picked up and run in the hole for the walkaway VSP survey, using the Flinders Tide to tow the source. The tool became stuck with the top of the tool at 1826 metres. The Schlumberger logging sheaves were rigged down and equipment rigged up to cut and strip over the wireline. The stripping was run in the hole over the wireline and the tool became free with the bottom of the pipe at 1638 metres. The tools were then pulled out of the hole and layed down and the fishing equipment rigged down. The weekly BOP tests were conducted before picking up a 12 1/4" drilling assembly to ream the hole. The drilling assembly was tripped in to 1600 metres and the hole washed and reamed from 1600 to 1900 metres. The drilling assembly was then tripped to 2715 metres and the hole washed and reamed from 2715 to 2863 metres. Gas was circulated out at 2863 metres with a maximum reading of 1008 units. Reaming was then continued from 2863 to 3149 metres before a 100 barrel gel sweep was circulated. The hole was then back reamed from 3149 to 2737 metres before tripping back down to 3111 metres and washing and reaming from 3111 to 3149 metres. A 50 barrel gel sweep and bottoms up were circulated before back reaming from 3149 to 3025 metres and pulling out of the hole. Schlumberger were then rigged up to continue running MDT samples. The tool could not pass 2649 metres and was pulled out of the hole. Schlumberger were rigged down and a 12 1/4" drilling assembly picked up and run in hole to 2584 metres. The hole was washed and reamed from 2584 to 2808 metres, where bottoms up was circulated. Washing and reaming was then continued from 2808 to 3149 metres while raising the mud weight from 9.5 to 10.0 ppg. The hole was then circulated clean and back reaming performed from 3149 to 2600 metres. The hole was then reamed from 2600 to 3149 metres before circulating a 50 barrel gel sweep and pulling out of the hole with back reaming between 3149 and 2953 metres. Schlumberger were then rigged up and the CSAT checkshot and zero offset VSP surveys run. The CST sidewall cores were then run, with 38 of the 60 shots recovered. Schlumberger were then rigged down. The 9 5/8" casing hanger and running tools were made up and stood back in the derrick. A 12 1/4" drilling assembly was made up and run in the hole to 2877 metres. The hole was washed and reamed from 2877 to 3050 metres. Mud was circulated and conditioned for two hours before pulling out to run casing. 213 joints of 47 lbs/ft 9 5/8" casing were run with two pip tags and 3 pup joints. The casing shoe landed at 2946.2 metres and the casing was cemented with 703 sacks of class 'G' cement. The weekly BOP pressure test was conducted before displacing the surface lines and riser with 8.8 ppg brine. The 9 5/8" wear bushing was run and set and 8" drill collars layed down. The casing scraper was picked along with a 8 1/2" bit and run in the hole on the end of 3 1/2" tubing to 2911 metres and washed down to 2919 metres (float collar set at 2921 metres). The casing was circulated and swept with a high viscosity pill prior to pulling out to run Schlumberger cement/casing logs. CBL-CET-VDL-CCL-GR logs were run from 2919 to 2520 with the top of cement logged at 2570 metres. Schlumberger were then rigged down and production test equipment rigged up and pressure tested.

The test string was run in the hole, filling the tubing with diesel every ten stands and pressure testing the tubing to 3000 psi. The subsea test tree was rigged up and run in the hole. Schlumberger were rigged up to run GR-CCL for the perforations. Production test zone #1 was perforated between 2840.5 to 2846 metres and flowed for 15 minutes. The well was then shut in to monitor pressure build up. Failure to latch into the model E valve with SRO gauges meant shut in pressures could not be monitored. The gauges were pulled out of the hole and the well flowed in an attempt to clean possible debris from the valve. The well was then shut in and the

gauges rerun. The gauges did not appear to be reading formation pressure and failed when the well was opened. The well was shut in again and an attempt made to pull the gauges out on wireline. The gauges became stuck at 2770 metres before the well was opened and flowed at 1602 barrels of oil and 1.71 MSCF of gas per day. The well was then shut in and killed before again attempting to pull out the Schlumberger wireline. After the wireline failed, the test tree was rigged down and the test string pulled out of the hole. The test tools and top drive were serviced before tripping back in the hole to retest zone #1. The surface test tree was rigged up and tested and the test tubing tested to 3000 psi. The well was opened and allowed to clean up. The final stabilised flow rate was 6640 barrels of oil and 7.88 MSCF of gas per day. The well was shut in prior to flowing for 30 minutes and shutting in again to run HRS bottom hole sample tools on Schlumberger wireline. The well was then flowed for 15 minutes before the sample tool was fired and the well shut in while the sample tool was pulled out of the hole. The well was then killed and the test string pulled out of the hole. Schlumberger were then rigged up to run and set an EZSV bridge plug at 2838.1 metres. The test string was then run in the hole for production test zone #2 and Schlumberger rigged up to run a GR-CCL log for the perforations. Production test zone #2 was perforated between 2829.5 and 2834 metres. The well was flowed and shut in before being reopened and yielding a final flow rate of 5659 barrels of oil per day. The well was again shut in before running in with a mechanical clock bottom hole sampler on Schlumberger wireline and flowing the well to take a bottom hole sample. The bottom hole sampler was then pulled out of the hole and the well killed.

Following the completion of the production testing program, Schlumberger were rigged up to run cased hole RFT samples. Three segregated samples were collected before an EZSV bridge plug was run in on Schlumberger wireline and set at 2827 metres. Schlumberger were rigged down and a 3 1/2" tubing stinger run in the hole. The top of the bridge plug was tagged at 2826 metres and bottoms up circulated with a maximum gas reading of 1568 units. Cement plug #1 was then set from 2823 to 2673 metres using 175 sacks of class 'G' cement at slurry density of 15.8 ppg. The cementing equipment was then pulled out of the hole and Schlumberger rigged up to run a 9 5/8" Pingo casing cutter. After cutting the casing, Schlumberger were rigged down and the hole was circulated with sea water. The 9 5/8" casing was then pulled out of the hole and Schlumberger rigged up to finish running the walkaway VSP survey using the Maersk Lifter to tow the source. Three levels were shot to complete the VSP and Schlumberger were rigged down.

The 3 1/2" tubing stinger was then run in the hole and cement plug #2 set from 1841 to 1691 metres using 375 sacks of class 'G' cement at a slurry density of 15.8 ppg. The stinger was then pulled out to 1183 metres and cement plug #3 set using 430 sacks of class 'G' cement at a slurry density of 15.8 ppg. The stinger was then pulled out to 1000 metres and bottoms up circulated while waiting on cement. The top of cement plug #3 was tagged at 1052 metres before pulling out to 525 metres and setting cement plug #4 with 250 sacks of class 'G' cement at a slurry density of 15.8 ppg. After circulating the hole while waiting on cement, the top of cement plug #4 was tagged at 426 metres. The stinger and drill pipe were then pulled out of the hole and the BOP and riser pulled. The rig was then deballasted and the anchors pulled using the Maersk Lifter and the Lady Caroline. The Atwood Falcon was released at 15:15 hours on November 1st, 1992.

•	Depth m	<u>%</u>	Description
1	1450-80	100	LIMESTONE: Off white to light grey, pale brown, buff, calcisiltite, occasional calcarenite, occasional to moderate argillaceous matrix, occasional carbonaceous flecks, common forams, trace glauconite, poor visible porosity, no shows.
1	1480-1510	100	LIMESTONE: Off white to pale brown, buff, occasionally pale blue grey, calcisiltite to calcarenite, common pale brown to off white argillaceous matrix, occasional carbonaceous flecks, occasional forams, trace glauconite, firm, poor visible porosity, no shows.
	1510-40	100	LIMESTONE: Off white to light grey, pale brown, calcarenite, very fine to fine, moderate to well sorted, argillaceous matrix, micaceous in part, slightly carbonaceous, occasional forams, poor visible porosity.
1	1540-70	100	LIMESTONE: Generally as above, poor visible porosity, no shows.
1	1570-1600	100	LIMESTONE: Light to medium grey, grey brown, occasionally off white, calcarenite, locally calcisiltite, very fine to fine calcareous sand, occasional to minor carbonaceous flecks, occasional lithics, no visible porosity, no shows, occasional mineral fluorescence.
1	1600-30	100	LIMESTONE: Light to medium grey, off white, grey brown, calcarenite, very fine to fine, argillaceous matrix, firm to occasionally moderately hard, crumbly to blocky, no visible porosity, no shows.
	1630-60	100	LIMESTONE: Light to medium grey, brown grey, calcarenite, very fine to fine, common argillaceous matrix, friable to firm, occasionally moderately hard, occasional carbonaceous flecks, occasional forams, trace glauconite, occasional lithics, poor visible porosity, no shows, mineral fluorescence.
	1660-90	100	LIMESTONE: Light to medium grey, dominantly brown grey, calcarenite, very fine to fine, crystalline, locally moderate argillaceous matrix, occasional carbonaceous matter, rare glauconite, occasional lithics, firm to occasionally moderately hard, occasional forams, poor to nil visible porosity, no shows, mineral fluorescence.
1	1690-1720	100	LIMESTONE: Generally as above, poor to nil visible porosity, no shows, mineral fluorescence.

	Depth m	<u>%</u>	Description
	1720-1750	100	LIMESTONE: Light to medium grey, brown, off white very fine to fine, calcarenite, calcisiltite, crystalline, common argillaceous matrix, friable, firm, occasionally moderately hard, occasional fossil fragments, forams, poor visible porosity, no shows, mineral fluorescence.
- 1 1	1750-80	100	LIMESTONE: Light to medium grey brown, calcilutite to calcisilitite, rare calcarenite, abundant argillaceous matrix, soft to firm, occasionally moderately hard, occasional carbonaceous flecks, rare glauconite, no visible porosity, no shows, mineral fluorescence in part.
	1780-1810	100	LIMESTONE: Light to medium brown, calcisiltite to calcilutite, common argillaceous/micritic matrix, occasional carbonaceous flecks, trace glauconite, firm to occasionally moderately hard, no visible porosity, no shows.
	1810-40	100	LIMESTONE: Generally as above, dominantly calcisiltite, no visible porosity, no shows.
	1840-70	100	LIMESTONE: Light grey to off white, light grey brown, calcisiltite to calcilutite, common to abundant argillaceous/micritic matrix, firm to occasionally moderately hard, crumbly to blocky, minor gluaconite, occasional carbonaceous flecks, nil to poor visible porosity.
#  }  -	1870-1900	100	LIMESTONE: Light to medium grey, grey brown, calcisiltite to occasionally calcarenite, common argillaceous matrix, micritic, minor glauconite, carbonaceous flecks, firm to moderately hard, nil visible porosity, no shows.
	1900-1930	100	LIMESTONE: Generally as above, nil porosity, no shows.
	1930-60	100	LIMESTONE: Off white to dominantly medium brown grey, calcisiltite, common micritic/argillaceous matrix, firm, blocky to crumbly, trace glauconite, minor carbonaceous flecks, nil visible porosity, no shows.
	1960-90	100	LIMESTONE: Medium brown grey, occasionally off white, calcisiltite, occasionally grading to calcarenite, common argillaceous (micritic) matrix, firm to occasionally moderately hard, occasional

	Depth m	<u>%</u>	Description
			glauconite, occasional carbonaceous flecks, lithics in part, poor visible porosity, no shows.
•	1990-2020	100	LIMESTONE: Generally as above.
1	2020-2030	100	LIMESTONE: Light to medium grey brown, off white in part, calcisilite to very fine calcarenite, common to abundant argillaceous matrix, firm to occasionally moderately hard, blocky, occasional glauconite, occasional carbonaceous flecks, occasional forams, very poor visible porosity.
	2030-40	100	LIMESTONE: Generally as above, no show.
1	2040-50	100	LIMESTONE: Off white to light grey, pale brown, calcisiltite to calcarenite, common white to pale brown argillaceous matrix (micritic), occasional glauconite, occasional carbonaceous specks, firm to occasionally moderately hard, blocky to crumbly, occasional forams, nil to very poor visible porosity, no shows.
c Í	2050-60	100	LIMESTONE: Generally as above, generally very fine calcarenite, nil to very poor visible porosity, no shows.
<b>E</b>	2060-70	100	LIMESTONE: Light to medium grey to brown, dominantly calcisilitie, grading to calcilutite, commonly argillaceous, firm to friable, blocky, rare to locally common glauconite, occasional carbonaceous flecks, occasional to rare forams, nil visible porosity, no show.
1	2070-80	100	LIMESTONE: Light to medium brown grey, occasionally off white, buff, generally calcisiltite, commonly argillaceous, locally common glauconite, occasional carbonaceous matter, firm, blocky to crumbly, nil visible porosity.
: ! !	2080-90	100	LIMESTONE: Light to medium brown grey, off white, calcisiltite, grading to very fine calcarenite, common argillaceous/micritic matrix, occasional to locally common glauconite, occasional carbonaceous specks, rare to occasional forams and microfossils, firm to occasionally moderately hard, nil to very poor porosity, no show.
1	2090-2100	100	LIMESTONE: Light to medium brown grey, light to medium grey, calcisiltite to very fine calcarenite, common argillaceous/micritic matrix, trace to locally common glauconite,

Depth r	<u>n</u>	<u>%</u>	Description
			trace carbonaceous specks, trace forams and microfossils, trace vein calcite, firm to moderately hard, blocky, nil visible porosity, trace mineral fluorescence.
2100-10	)	100	LIMESTONE: Light grey, light to medium brown grey, calcisiltite to very fine calcarenite, common argillaceous matrix, trace glauconite, trace carbonaceous specks, trace vein calcite, trace forams, soft to firm, occasionally moderately hard, blocky, nil visible porosity, trace mineral fluorescence.
2110-20	)	100	LIMESTONE: Medium brown grey, grey, occasionally off white to light grey, calcisiltite to very fine calcarenite, common argillaceous/micritic matrix, trace to common glauconite, trace to locally common carbonaceous specks, trace to common vein calcite, trace forams, firm to hard, blocky to platy, nil visible porosity, trace to common mineral fluorescence.
2120-30	0	100	LIMESTONE: Light to predominantly medium brown grey, grey, occasionally off white, predominantly calcisiltite, occasionally very fine calcarenite, abundant argillaceous matrix, trace glauconite, trace carbonaceous specks, trace vein calcite, firm to moderately hard, occasionally hard, blocky to occasionally platy, nil visible porosity, trace mineral fluorescence.
2130-40	0	100	LIMESTONE: Light to medium brown grey to grey, calcisiltite to very fine calcarenite, abundant argillaceous matrix, trace glauconite, trace carbonaceous specks, firm to moderately hard, occasionally hard, blocky to occasionally platy, nil visible porosity.
2140-5	0	100	LIMESTONE: As above.
2150-6	0	100	LIMESTONE: Light grey to brown grey, occasionally off white, occasionally medium brown grey, common argillaceous and micritic matrix, trace to locally common glauconite and carbonaceous specks, trace forams and microfossils, trace vein calcite, firm to moderately hard, blocky, nil visible porosity, calcisiltite to very fine calcarenite.
2160-7	0	100	LIMESTONE: Light to predominantly medium brown grey, occasionally light grey, calcisiltite to very fine calcarenite, common argillaceous matrix, trace to locally common glauconite and carbonaceous specks, firm to moderately hard, nil visible porosity.

•	Depth m	<u>%</u>	<u>Description</u>
1 1	2170-80	100	LIMESTONE: As above, glauconite and carbonaceous specks less common, blocky to occasionally platy.
	2180-90	100	LIMESTONE: Light to medium brown grey to grey, as above, common to abundant micritic/argillaceous matrix.
	2190-2200	100	LIMESTONE: Light to predominantly medium grey, occasionally brown grey, calcisiltite, occasionally very fine calcarenite, common argillaceous matrix, trace glauconite, trace carbonaceous specks, rare mica, firm, blocky to platy, nil visible porosity.
	2200-10	100	LIMESTONE: Light to medium brown grey to grey, calcisiltite to very fine calcarenite, common argillaceous/micritic matrix, trace glauconite, trace to locally common carbonaceous specks, firm to occasionally moderately hard, nil visible porosity.
1	2210-20	100	LIMESTONE: As above, soft to firm, occasionally moderately hard, trace microfossils.
3	2220-30	100	LIMESTONE: As above.
	2230-40	100	LIMESTONE: As above, trace forams, trace vein calcite.
•	2240-50		No returns - displacing to KCL/PHPA mud.
1	2250-60	100	LIMESTONE: Light to medium brown grey, calcisiltite, grading to calcilutite in part, common micritic/argillaceous matrix, firm to hard, blocky to subplaty, occasional glauconite, occasional carbonaceous flecks, nil visible porosity, no shows.
1	2260-70	100	LIMESTONE: Generally as above.
<b>8</b>	2270-80	100	LIMESTONE: Light to medium grey brown, calcisiltite to calcilutite, argillaceous matrix, firm to hard, occasional glauconite, occasional fossil fragments, forams, nil visible porosity, no show.
	2280-90	100	LIMESTONE: Light to medium brown grey, olive green grey, calcisiltite to calcilutite, argillaceous, occasional glauconite and carbonaceous matter, firm to dominantly moderately hard, blocky to subplaty, nil visible porosity, no shows.
•	2290-2300	100	LIMESTONE: Generally as above.

	Depth m	<u>%</u>	Description
1	2300-10	100	LIMESTONE: Light to medium brown grey, occasionally olive green grey, calcisiltite to calcilutite in part, argillaceous to micritic matrix, occasional fossil fragments, forams, nil to very poor porosity, no shows.
	2310-20	100	LIMESTONE: Light to medium grey, occasionally grey brown, dominantly calcisiltite, commonly argillaceous, occasional gluaconite and carbonaceous specks, rarely grades to calcarenite, firm to moderately hard, blocky, nil to very poor visible porosity, no shows.
	2320-30	100	LIMESTONE: As above, no visible porosity, no shows.
: 1	2330-40	100	LIMESTONE: Light to medium grey, calcisiltite, firm to moderately hard, argillaceous, no visible porosity, no shows.
	2340-50	100	LIMESTONE: Generally as above.
	2350-60	100	LIMESTONE: Light to medium grey, dominant calcisiltite, occasionally grades to calcarenite, common off white to light grey argillaceous matrix (micritic), occasional glauconite and carbonaceous flecks, nil to poor visible porosity, no shows.
<b>E</b>	2360-70	100	LIMESTONE: Off white to light grey, medium grey brown, calcisiltite, firm to moderately hard, very poor to nil porosity.
1	2370-80	100	LIMESTONE: Light to medium grey, off white to light grey brown, calcisiltite, commonly argillaceous, occasional glauconite and carbonaceous flecks, occasional forams, nil to very poor visible porosity, no shows.
1	2380-90	100	LIMESTONE: Generally as above, nil visible porosity, no shows.
<b>1</b>	2390-2400	100	LIMESTONE: Light to medium grey, grey brown, calcisilitie, grades to calcilutite, commonly argillaceous, minor glauconite, occasional carbonaceous matter, firm to occasionally moderately hard, nil visible porosity, no shows.
1	2400-10	100	LIMESTONE: Off white to light grey, occasionally light to medium grey brown, dominantly calcilutite, occasionally calcisiltite, commonly argillaceous, minor glauconite, occasional carbonaceous flecks, soft to firm,

Ī	Depth m	<u>%</u>	<u>Description</u>
1			amorphous to blocky, nil visible porosity, no shows.
	2410-20	100	LIMESTONE: Off white to light grey, occasionally light to medium grey brown, calcilutite to calcisiltite, common to abundant argillaceous matrix, minor glauconite, occasional to minor carbonaceous specks, soft to firm, amorphous to blocky, nil visible porosity, no shows.
	2420-40	100	LIMESTONE: Light grey, occasional light to medium grey brown, calcilutite, occasionally calcisiltite, moderately to very argillaceous, slightly micritic in part, trace carbonaceous specks, soft, occasionally moderately hard, amorphous to blocky, nil visible porosity, no shows.
	2440-50	100	LIMESTONE: Off white to light grey, calcilutite, very argillaceous, trace carbonaceous specks, trace glauconite, soft to dispersive, amorphous to blocky, nil visible porosity, no shows.
	2450-60	20	LIMESTONE: Off white to light grey, occasionally medium grey, grey brown, calcilutite, very argillaceous, grades to calcareous claystone, minor glauconite, occasional disseminated pyrite, soft to occasionally firm, amorphous to blocky, nil visible porosity, no shows.  CLAYSTONE: Off white to light grey, soft to firm, very calcareous, grades to argillaceous limestone, amorphous to blocky, slightly dispersive.
	2460-70	<ul><li>60</li><li>40</li></ul>	CLAYSTONE: Off white to light grey, soft to firm, amorphous to subblocky, very calcareous, grades to argillaceous limestone. LIMESTONE: Light to medium grey, off white, calcilutite, very argillaceous, grades to calcareous claystone, firm, blocky, no visible porosity, no shows.
	2470-80	20	CLAYSTONE: Light to medium grey, occasionally blue grey, soft to occasionally firm, amorphous to subblocky, very calcareous grades to argillaceous limestone (calcilutite), trace disseminated pyrite, occasional carbonaceous flecks, occasional forams.  LIMESTONE: Dominantly as above, nil visible porosity, no shows.
	2480-90	100	CLAYSTONE: Light to medium grey, off white, soft to moderately firm in part,

	Depth m	<u>%</u>	Description
1			amorphous, slightly dispersive, sticky, very calcareous, grades to argillaceous limestone, occasional glauconite and carbonaceous specks.
t	2490-2500	100	CLAYSTONE: Light grey, moderately to very calcareous, trace glauconite, trace carbonaceous specks, trace pyrite, soft to firm in part, amorphous, slightly dispersive.
1	2500-05	100	CLAYSTONE: Light to medium grey, very calcareous, trace to locally common glauconite and carbonaceous specks, trace pyrite, soft to firm, amorphous to blocky, slightly silty in part.
1	2505-10	100	CLAYSTONE: Off white to light grey, very calcareous, locally grades to argillaceous limestone (calcilutite), trace glauconite, trace carbonaceous specks, trace pyrite, soft, slightly to moderately dispersive, amorphous.
- 1 1	2510-15	100	CLAYSTONE: Off white to light grey, occasionally medium grey, very calcareous, trace carbonaceous specks, trace pyrite, soft, rarely firm to moderately hard, slightly dispersive, amorphous to occasionally blocky, trace forams.
_	2515-20	100	CLAYSTONE: As above, trace glauconite.
! !	2520-30	100	CLAYSTONE: Off white to light grey, very calcareous, trace carbonaceous specks, trace forams and microfossils, soft, moderately dispersive, amorphous to occasionally blocky.
1	2530-35	100	CLAYSTONE: As above, trace disseminated pyrite, occasionally firm to moderately hard.
1	2535-40	100	CLAYSTONE: Off white to light grey, very calcareous, trace carbonaceous specks, trace pyrite, soft, slightly dispersive, amorphous to occasionally blocky.
<b>1</b>	2540-45	100	CLAYSTONE: Light to medium grey, occasionally off white, medium grey, trace carbonaceous specks, soft to firm, slightly dispersive, amorphous to blocky, slightly silty in part, very calcareous.
1 1	2545-50	100	CLAYSTONE: Predominantly light grey, occasionally off white, occasionally medium grey, trace carbonaceous specks, soft to firm, slightly dispersive, amorphous to blocky, slightly silty in part, very calcareous.

	Depth m	<u>%</u>	Description
I I	2550-55	100	CLAYSTONE: Light grey, very calcareous, trace carbonaceous specks, trace glauconite, soft, rarely firm, slightly dispersive in part, amorphous to blocky, trace mineral fluorescence.
t 1	2555-60	100	CLAYSTONE: Light grey, occasionally off white to light grey brown, moderately to very calcareous, trace carbonaceous specks, soft, moderately dispersive, amorphous to blocky, slightly sticky in part.
	2560-65	100	CLAYSTONE: Light to occasionally medium grey, occasionally off white, moderately to predominantly very calcareous, trace carbonaceous specks, soft, slightly dispersive, amorphous to blocky.
	2565-75	100	CLAYSTONE: As above, trace glauconite, trace pyrite, slightly sticky in part.
1	2575-85	100	CLAYSTONE: Off white to light grey, medium grey to grey green, moderately to very calcareous, trace carbonaceous specks, trace to locally common glauconite where grey green, trace disseminated pyrite, trace forams, soft, slightly dispersive, amorphous to blocky.
Į.	2585-95	100	CLAYSTONE: As above, very calcareous, trace vein pyrite.
I I I	2595-2605	100	CLAYSTONE: Light grey, medium grey to grey green, moderately to predominantly very calcareous, trace carbonaceous specks and microlaminae, trace to locally common glauconite, trace disseminated and vein pyrite, trace forams and microfossils, trace lithics, soft to firm, slightly dispersive, amorphous to blocky, slightly silty in part.
1	2605-10	100	CLAYSTONE: Light to medium grey, moderately to occasionally very calcareous, trace carbonaceous specks, trace glauconite, trace to locally common disseminated and vein pyrite, trace to locally common forams and microfossils, trace lithics, soft to firm, slightly dispersive, amorphous to blocky.
	2610-20	100	CLAYSTONE: As above, predominantly very calcareous.
1	2620-25	100	CLAYSTONE: Light to medium grey, off white, moderately calcareous, trace carbonaceous specks, trace glauconite, trace forams and microfossils, trace to common vein and disseminated pyrite, soft to firm,

•	Depth m	<u>%</u>	Description
1			slightly dispersive, amorphous to blocky, subfissile in part.

1 1			moderate sorting, angular to subrounded, trace to common off white to light grey argillaceous matrix, trace mica, trace glauconite, trace pyrite, loose, inferred good porosity, no shows.
1 1	2995-3000	100	SANDSTONE: Clear to translucent, off white to light grey, fine to coarse, occasionally very coarse, poor sorting, subangular to rounded, common off white to light grey brown argillaceous matrix, trace glauconite, trace mica, trace nodular pyrite, slightly chloritic in part, loose, inferred fair to good porosity, no shows.
	3000-05	100	SANDSTONE: Clear to translucent, light to medium grey, fine to coarse, moderate sorting, common to locally abundant off white to light grey brown argillaceous matrix, matrix occasionally medium grey brown, trace mica, trace glauconite, trace chlorite, trace to common smoky and milky quartz, trace pyrite, loose, inferred fair porosity.
6 8 e	3005-10	100	SANDSTONE: Clear to translucent, light grey, very fine to coarse, subangular to subrounded, poor sorting, trace light to medium grey brown argillaceous matrix, trace mica, trace pyrite, trace chlorite, trace smoky and milky quartz, loose, inferred good porosity, no shows.
1 1	3010-15	100	SANDSTONE: Clear to translucent, off white to light grey, medium to coarse, good sorting, subangular to subrounded, slight trace white argillaceous matrix, trace pyrite, trace lithics, loose, inferred very good to excellent porosity, no show.
I	3015-20	100	SANDSTONE: Clear to translucent, white to light grey, milky, medium to very coarse, dominantly coarse, subrounded to rounded, minor white argillaceous matrix, trace nodular pyrite, commonly clean, loose, good to very good inferred porosity, no shows.
! !	3020-25	100	SANDSTONE: Clear to translucent, white to light grey, medium to very coarse, moderate to well sorted, subangular to occasionally round, minor white argillaceous matrix, common loose, clean, very good inferred porosity, no shows.
	3025-30	30	CLAYSTONE: Medium to dark grey, dominantly medium grey, occasionally grey brown, soft, streaky, slightly arenaceous, grades to siltstone in part.

Depth m	<u>%</u>	Description
	10	SILTSTONE: Medium to dark grey, locally arenaceous, slightly carbonaceous, micromicaceous, firm, blocky.
	60	SANDSTONE: Dominantly as above.
3030-35	50	CLAYSTONE: Light to dominantly medium grey, occasionally dark grey, grey brown in part, soft, sticky, amorphous, slightly arenaceous, micromicaceous grades to siltstone in part.
	10	SILTSTONE: Medium to dark grey, brown grey in part, commonly arenaceous, micromicaceous, slightly carbonaceous, firm, blocky.
	40	SANDSTONE: Clear to translucent, white to light grey, medium to very coarse, dominantly coarse, moderately sorted, subrounded, moderate argillaceous matrix, loose, poor to fair inferred porosity.
3035-40	70	CLAYSTONE: Light to dominantly medium grey, occasionally dark grey, soft, streaky, amorphous to blocky, slightly arenaceous, occasional very fine sand, micromicaceous.
	10	SILTSTONE: Dominantly as above, grades to claystone.
<b>1</b>	20	SANDSTONE: Dominantly as above, no shows.
3040-45	30	CLAYSTONE: Light to medium grey, pale brown to medium brown grey, slightly to moderately arenaceous, grades to siltstone, soft, sticky, amorphous.
	20	SILTSTONE: Light to medium grey, medium brown grey, commonly arenaceous, micromicaceous, slightly carbonaceous, occasional nodular pyrite, firm, blocky.
	50	SANDSTONE: Clear to translucent, white to light grey, medium to very coarse, dominantly coarse, moderately to well sorted, subrounded to occasionally rounded, moderate argillaceous matrix in part, generally loose, poor to locally fair inferred porosity, no shows.
3045-50	80	SANDSTONE: Clear to translucent, light grey, milky to smoky quartz, medium to very coarse, moderate sorting, angular to dominantly subrounded, no visible cement, trace white argillaceous matrix, loose, good inferred porosity, no shows.
	10	SILTSTONE: Light to medium grey, moderately to commonly arenaceous, common very fine disseminated pyrite, firm, blocky, slightly carbonaceous in part.
1	10	CLAYSTONE: Light to medium grey, pale brown, slightly arenaceous, soft, streaky, amorphous.

Depth m	<u>%</u>	Description
3050-55	50 50	CLAYSTONE: Light to medium grey, brown grey, off white, slightly arenaceous, soft, sticky, amorphous.  SANDSTONE: Clear to translucent, light grey, frosted, medium to coarse, occasionally very coarse, moderately sorted, angular to subrounded, dominantly subrounded, weak silica cement, occasional to locally common pale brown to off white argillaceous matrix, occasional orange mineral? dominantly loose, poor to fair inferred porosity.
3055-60	60 40	SANDSTONE: Dominantly as above, occasional nodular pyrite. CLAYSTONE: Dominantly as above.
3060-65	60	SANDSTONE: Clear to translucent, light grey to off white, frosted, medium to very coarse, dominantly coarse, moderate sorting, subangular to subrounded, minor white to light brown argillaceous matrix, common pyrite nodules, dominantly loose, fair to good inferred porosity, no shows.
<b>.</b> 2	40	CLAYSTONE: Light to medium brown, grey brown, occasionally off white, very slightly arenaceous, commonly silty, dominantly soft, sticky, amorphous.
3065-70	20	CLAYSTONE: Light to medium brown, grey brown, slightly arenaceous, common pyrite nodules, slightly silty, occasional very fine sand, firm to dominantly soft, sticky, amorphous to occasionally subblocky. SANDSTONE: Dominantly as above.
3070-75	100	CLAYSTONE: Pale brown to medium grey brown, soft, slightly dispersive, occasional to common pyrite nodules, amorphous.
3075-80	100	CLAYSTONE: Dominantly as above, slightly arenaceous, commonly dispersive, soft, amorphous.
3080-85	100	CLAYSTONE: Medium to dark brown, brown grey, soft, slightly dispersive, sticky, non calcareous, amorphous.
3085-90	60	SANDSTONE: Clear to translucent, smoky, frosted fine to very coarse dominantly medium to coarse, poorly sorted, angular to subrounded, moderate silica cement, common white argillaceous matrix, friable to loose, poor to locally fair inferred porosity. 20% Very dull patchy yellow green fluorescence, no cut.
•	40	CLAYSTONE: Dominantly as above.

<u>Depth m</u>	<u>%</u>	<u>Description</u>
3090-95	70 30	SANDSTONE: Clear to translucent, light grey, smoky, frosted in part, fine to very coarse, dominantly medium, poorly sorted, angular to occasionally subrounded, weak to moderate silica cement, white argillaceous matrix, occasional mica, minor very fine disseminated pyrite, occasional nodular pyrite, friable to loose, poor to locally fair inferred porosity, 20% dull to very dull pale yellow green spotted to patchy fluorescence, very weak faint pale yellow green crush cut, faint residue ring.  CLAYSTONE: Dominantly as above.
3095-3100	70 30	SANDSTONE: Dominantly as above, predominantly medium to coarse, poor to moderate sorting, angular to subrounded, weak to locally moderate silica cement, common white argillaceous matrix, generally friable to loose, poor to locally fair inferred porosity, 20% moderately bright yellow green solid fluorescence as above.  CLAYSTONE: Light to medium brown, grey
		brown, commonly arenaceous, grades to siltstone in part, micromicaceous, soft to occasionally firm, amorphous to blocky.
3100-05	50	SANDSTONE: Clear to translucent, light grey, fine to very coarse, dominantly fine to medium, very poorly sorted, angular to subrounded, common to abundant silica cement, quartz overgrowths, common white argillaceous matrix, common disseminated pyrite, occasional mica, moderately hard to friable, occasionally loose, poor visible porosity, 20% very dull yellow green patchy fluorescence, very weak faint pale yellow green crush cut, faint trace residue ring.
	50	CLAYSTONE: Medium to pale brown, light grey, grey brown, slightly arenaceous, micromicaceous, occasional very fine disseminated pyrite, soft to firm, firm, slightly dispersive, occasionally silty, blocky to amorphous.
3105-3110	70	SANDSTONE: Clear to translucent, light grey, medium to coarse, occasionally fine, poorly sorted, angular to subrounded, moderate to common silica cement, common white argillaceous matrix, friable to loose, poor inferred porosity, 30% very dull to dull pale yellow green patchy fluorescence, very weak cut to faint pale yellow green crush cut, faint residue ring.
<b>5</b>	30	CLAYSTONE: Dominantly as above.

Depth m	<u>%</u>	Description
3110-15	90	CLAYSTONE: Pale brown to medium brown, light grey, common very fine sand inclusions, silty in part, micromicaceous, occasional nodular pyrite, soft, dispersive, amorphous.
1	10	SANDSTONE: Dominantly as above, trace fluorescence as above.
3115-20	70	CLAYSTONE: Light to medium brown, light grey, off white, common very fine sand, silty, micromicaceous, soft to occasionally firm, slightly silty, amorphous to subblocky.
	30	SANDSTONE: Clear to translucent, light grey, fine to coarse, dominantly medium, poorly sorted, angular to subrounded, moderate silica cement, common pale brown to light grey argillaceous matrix, occasional very fine disseminated pyrite coating grains, friable to brittle, poor inferred porosity, trace fluorescence as above.
3120-25	40	SANDSTONE: As above, trace very dull yellow green patchy to speckled fluorescence, very weak faint crush cut, trace ring residue.
	60	CLAYSTONE: Pale to medium brown, light grey to off white, occasional to common very fine sand, micromicaceous in part, soft to occasionally firm, amorphous to blocky.
3125-30	80	SANDSTONE: Clear to translucent, light grey, frosted, smoky quartz, commonly very coarse to coarse, moderate sorting, angular to subrounded, occasional silica cement, occasional fractured quartz grains, minor argillaceous matrix, occasional pyrite nodules, commonly loose, good inferred porosity nil to trace fluorescence dominantly as above.
• .	20	CLAYSTONE: As above.
3130-35	80	SANDSTONE: Dominantly as above, loose, generally clean, good inferred porosity. CLAYSTONE: Generally as above.
3135-3140	90	SANDSTONE: Clear to translucent, medium to very coarse, dominantly medium to coarse, poor to moderate sorting, angular to
		subrounded, occasional silica cement, no visible matrix, occasional disseminated pyrite, dominantly clean, loose, fair to good inferred porosity, 20% very dull to occasionally moderately bright yellow green speckled to patchy fluorescence, no cut, very weak pale yellow green crush cut, nil to trace residue ring.
}	10	CLAYSTONE: As above.

Depth m	<u>%</u>	Description
3140-45	100	SANDSTONE: Clear to translucent, medium to very coarse, dominantly medium to coarse, poor to moderate sorting, angular to subrounded, weak silica cement in part, locally common white argillaceous matrix, occasional pyrite nodules, clean in part, loose, fair inferred porosity, 40-50% very dull to dull occasionally moderate bright pale yellow green patchy fluorescence, no cut, very faint pale yellow green crush cut, no residue to very faint pale yellow green residue ring.
3145-50	20	SANDSTONE: Dominantly as above, fair inferred porosity, 30-40% very dull yellow green patchy fluorescence as above. CLAYSTONE: Light to medium brown, grey brown, slightly arenaceous in part, commonly soft to firm, amorphous to blocky.

#### **Descriptive Lithology**

SILTY SANDSTONE: Off white, very fine to fine, rarely medium, dominantly very fine, moderately to well sorted, subangular to subrounded, moderate silica/dolomitic cement, moderate argillaceous/silty matrix, common to abundant glauconite, muscovite mica, commonly grades to arenaceous siltstone, firm to moderately hard, poor visible porosity, 5-10% dull to moderately bright yellow green patchy fluorescence, fast milky white crush cut, faint residue ring.

SANDSTONE: Off white to light grey, clear to translucent, very fine to fine, rarely medium, well sorted, subangular to subrounded, moderate silica cement, common dolomitic cement, minor argillaceous/silty matrix, common to abundant glauconite, moderate to locally common disseminated pyrite, occasional muscovite mica, firm to hard, poor visible porosity, trace very dull yellow patchy fluorescence, slow pale green crush cut, faint to thin residue ring.

SANDSTONE: Off white to light grey, clear to translucent, very fine to fine, well sorted, subangular to subrounded, moderate dolomitic/silica cement, common glauconite, common disseminated pyrite (replacement), muscovite mica, firm to hard, poor visible porosity, 10-20% dull pale green yellow patchy fluorescence, slow milky pale green streaming cut, moderate residue ring.

SANDSTONE: Dominantly as above, common to abundant disseminated pyrite, occasional nodular pyrite, firm to hard, poor visible porosity, no visible fluorescence, faint pale yellow green diffuse crush cut, trace pale yellow residue ring.

SANDSTONE: Pale brown to off white, light grey, clear to translucent, very fine to fine, occasionally medium, dominantly very fine, well sorted, subangular to subrounded, weak to moderate silica/dolomitic cement, minor argillaceous matrix, common to abundant disseminated pyrite, locally abundant muscovite mica, common glauconite, firm to hard, poor visible porosity, 70% dull to moderately bright yellow green patchy fluorescence, weak to moderate pale green crush cut, thin residue ring.

SANDSTONE: Pale brown to off white, light grey, clear to translucent, very fine to fine, rarely medium, well sorted, subrounded to subangular, dolomitic/silica cement, common disseminated pyrite, common argillaceous matrix (altered feldspar), occasional clear feldspar flecks, occasional chlorite, common muscovite mica, common glauconite nodules, firm to hard, poor visible porosity, trace very dull patchy yellow green fluorescence, very weak faint yellow green crush cut, trace residue ring.

SANDSTONE: Pale brown to off white, (oil staining in part), clear to translucent, fine to coarse, dominantly fine to medium, poorly to moderately sorted, subangular to subrounded, weak silica cement, locally common dolomitic cement, common feldspar, chlorite, common glauconite, muscovite mica, moderate disseminated pyrite, poor visible porosity, 10-15% spotted yellow green fluorescence, moderately pale green milky streaming cut, moderately thin residue ring.

SANDSTONE: Pale brown to off white, light grey, very fine to fine, occasional coarse floating quartz grains, moderately to well sorted, subangular to occasionally angular, moderate silica cement, dolomitic in part, minor argillaceous matrix, occasional chlorite, common glauconite, common to abundant finely disseminated pyrite, occasional feldspar (altered in part), common muscovite mica, firm to moderately hard, friable in part, poor visible porosity, 5-10% very dull pinpoint patchy yellow green fluorescence, very slow pale green streaming cut, moderate slow crush cut, thin residue ring.

SANDSTONE: Pale brown to off white, clear to translucent, very fine to fine, occasionally medium, very rarely coarse, well sorted, subangular to subrounded, moderate silica cement, occasional dolomitic cement, common to abundant glauconite nodules, common finely disseminated pyrite, common muscovite mica, occasional feldspar, minor chlorite, firm to moderately hard occasionally friable, poor visible porosity, locally fair, 10-30% dull pale vellow green patchy fluorescence, slow pale green

BLACKBACK 2

PRODUCTION TEST REPORT

#### **BLACKBACK-2**

#### **WELL TESTING SUMMARY**

#### **GENERAL**

On the Blackback-2 well, three separate production tests were conducted to evaluate two zones, from 2841-2846.5m and 2829.5-2834m. A retest of the lower zone was required when the tubing string became restricted by a Surface Read-Out (SRO) assembly which was blown up the tubing string on the initial test. This WL assembly acted as a downhole choke and limited the flow response on the first final flow period. A high rate test was conducted in each zone, which realized combined flow rates of 12,299 BOPD and 16.1 MMSCF/D of gas. These rates were mechanically limited due to tubing and surface facility restrictions and are not adjusted for combined zone drawdown effect. No water production was experienced. The testing program commenced with the after-logging cleanup trip performed on October 12, 1992, prior to running the 9-5/8" production casing. Testing was concluded on October 27, 1992, prior to final well abandonment and after three cased hole RFTs were completed. Total testing time was 13.4 days. A summary of individual test performance is included in the attachments along with tool schematics and stabilized flow plots for each test.

#### PREPARATION FOR TESTING

After completion of Sidewall Coring, operations to prepare the well for testing commenced and included a hole conditioning trip, 9-5/8" casing running, changing the well over to completion fluid and cased hole logging. The hole conditioning trip was conducted with a 12-1/4" bit and BHA to a depth of 3050m without incident. The 9-5/8" casing string was run in 14 hours and set with its shoe at 2946m, 100m below the lowermost planned perforation. It was cemented with 703 sacks of Class G cement mixed in freshwater with 3 GP10B of HR-6L retarder. Several pup joints and 2 pip tags were run to assist in cased hole logging tie-ins. The casing was displaced with 630 Bbls of 8.8 ppg brine and the top cement plug bumped with 1500 psi. The 8.8 ppg brine provided 8.7 ppg downhole density based on the well temperature profile, for a 0.3 ppg or 144 psi overbalance based on a 8.4 ppg pore pressure. After setting the 9-5/8" pack-off and testing it to 3000 psi, the BOP was tested and the fluted SSTT hanger run to perform the space-out calculations. The 3-1/2" test tubing was then picked up and RIH with a casing scraper. The TOC inside the casing was tagged at 2919m, 2m above the float collar casing talley measurement, and the hole was circulated clean prior to POH. Two WL cased hole logging runs were made incorporating the CBL/CET/AMS and CCL/GR/AMS tools. The CBL indicated a good cement bond with the TOC outside the 9-5/8" casing at 2572m. The CET showed isolation of the test intervals from above and below them, with 7m of solid cement isolation between The casing was tested to 3000 psi before picking up the first TCP the two zones. assembly.

#### TEST 1 (ZONE 1) (2841-2846.5m)

The test assembly utilised for this zone was run as shown in the attachments, with the LPR-N valve run closed and filling the test string above the valve with diesel every 10 stands. The tubing was tested to 3000 psi at several points while running it. Although three slip joints were run, WL correlation of the TCP guns indicated that the first zone had to be shot 1m deeper than desired due to space out limitations, including full slip joint collapse at the packer setting depth. The deeper perforating did not pose significant enough well evaluation problems to mandate tripping to the SSTT to adjust the spaceout. After opening the LPR-N valve with 1400 psi of annulus pressure, the tubing was pressured to 3100 psi and bled to zero to actuate the 12 SPF TCP guns. The well was shot with a differential of 620 psi +/- and allowed to commence the initial flow period immediately, which was run for 15 minutes on a 16/64 choke. Wellhead pressure increased during this flow period to 690 psi and 11 barrels of diesel was recovered for equivalent rate of 1056 BFPD. After the WL SRO gauges were unable to be latched into Model "E" Adapter Sub downhole, the WL assembly was POH and a second short flow period was conducted. This time the well was flowed for 20 minutes during which the wellhead pressured increased from 730-900 psig and 25 barrels of diesel was recovered for an equivalent rate of 1800 BFPD. The WL SRO gauge assembly was RIH a second time and was latched into its downhole mating sub and held in place with a 500# overpull. Upon opening the well for the final flow period, the gauges were blown up the hole into the lowermost slip joint. This event, associated with improper assembly of the Model E Adapter Sub, is discussed in detail in the Cost Deviation Summary and Equipment Failure Sections of the Drilling Follow-up Report. A decision was made to continue to test the zone with the WL assembly stuck in the well.

The final flow period of this well was continued from 12.7 hours, followed by an 18.7 hour shut-in period. Flow rates averaged 1602 BOPD and 1.71 MMSCF/D of gas at 600 PSIG FWHP on a 48/64 choke. An 8.8 psi drawdown was observed giving a PI of 182. Since this small drawdown confirmed that the struck WL assembly was acting as a downhole choke, a decision was made to RIH to retest the zone on a high rate test without the use of WL gauges in the well. It was ascertained at 3 TCP shots did not fire once the guns were retrieved to surface. These 3 shots were located at 2844.5m MD.

#### TEST 1A (ZONE 1) (2841-2846.5m)

The high rate retest on this zone was highly successful. In order to reduce the time consumed filling the test string and minimise the risk of running it with open perforations, the LPR-N valve was run pinned open. The string was displaced with 63 barrels of diesel prior to setting the packer and pressuring the annulus to 1450 psig to close the LPR-N valve. The well was then opened for an 8.2 hour flow period, followed by a 12.5 hour shut-in period. Rates of 6640 BOPD and 7.88 MMSCF/D of gas were experienced with 930 psig FWHP on a 64/64 choke. The heater had to be bypassed as its 1" diameter restricted well flow. During the last 1/2 hour of the flow period, the well was opened on a 96/64 choke to ascertain ultimate flow rates, which peaked at 7100 BOPD and 8.66 MSCF/D of gas.

At this time, the flow rates became separator limited. Before pulling the test string, one bottom-hole sampler run was attempted, during which the electronic closing device failed to actuate due to a O-ring seal leak and resultant electrical short. A 76.5 psi drawdown was observed, giving a PI of 87. The zone was abandoned by setting a 9-5/8" EZSV-BP at MS:1t:93misc33

2838m and pressure testing it to 3000 psi. This plug was later swab tested to about 600 psig when the packer was set to test the upper set of perforations.

#### TEST 2 (ZONE 2) (2829.5-2834m)

Flow testing of this zone was also very successful. The test assembly utilised for this zone was run as shown in the attachments, but the LPR-N valve was run open to save time filling the tubing with diesel as noted on the prior test above. The tubing was tested to 2000 psi at several points while running it. Although only two slip joints were run (the other one had the WL gauge still stuck inside it at the surface), the WL log correlation enabled a space-out to perforate the zone in the correct place with the slip joints 1-1/2' from full collapse. After opening the LPR-N valve with 1400 psi of annulus pressure, the tubing was pressured to 3000 psi and bled to zero to actuate the 12 SPF TCP guns. The well was shot with a differential of 600 psi +/- and allowed to commence the initial flow period immediately, which was run from 15 minutes on a 16/64 choke. Wellhead pressure increased during this flow period to 630 psi and 11 barrels of diesel was recovered for equivalent rate of 1056 BFPD.

The final flow period of this well was continued for 8.2 hours, followed by an 12 hour shut-in period. Flow rates averaged 5659 BOPD and 8.24 MMSCF/D of gas at 929 PSIG FWHP on a 64/64 choke. Before pulling the test string, one bottom-hole sampling run was attempted, but was unsuccessful. It incorporated a mechanical closing device, which activated downhole. However, problems with the mercury pump and drainage system precluded recovery of the lower chamber sample. The sample in the upper chamber leaked out and was lost as the door to this chamber was lodged open with debris. A 247.9 psi drawdown was observed giving a PI of 23. After running 3 cased hole RFT's, this zone was abandoned by setting an EZSV-BP at 2826m and placing cement from 2823-2673m above the plug. The cement above the EZSV-BP was tested to 3000 psi prior to pulling the 9-5/8" casing. The 9-5/8" casing was then cut and pulled from 1811m to complete the Walkaway VSP run prior to final well abandonment. The final abandonment well sketch is in the Drilling Follow-up Report for the well.

#### **CONCLUSIONS AND RECOMMENDATIONS**

1. Overall testing time was 13.4 days including 3.0 days or 22.8% non-productive time (NPT). The most significant NPT event involved retesting of the lower zones as a result of improper assembly of the Model "E" adapter sub, which allow the SRO to be blown-up the test string.

Please see Blackback-2 Cost Deviation Summary and Final Well Report conclusions and recommendations concerning the use of WL SRO gauges in concert with downhole shut-in tools, as well as future Model "E" Sub use.

- 2. High rate testing of this well was very successful; however, both tests were mechanically limited. Higher flow rate tests in the future may require larger test tubing to be utilized and alternative surface test equipment to be procured. The heater unit had a 1" bore which limited high rate well flow and had to be bypassed. This contributed to the cold oil handling limitations at the separator. Use of a larger-bore heater and/or higher rate separator gear could improve test results. Provisions should be made for testing in warmer weather or for use of a heated or insulated flow system in the future, as pertinent.
- 3. No problems were experienced with hydrates during testing at this deepwater location with seafloor temperatures from 40-47 F. No hydrate inhibition chemicals were required to be injected into the system at any time, although provisions for this activity were made. No heated well fluids were circulated into the riser at any time while testing, as was done at Blackback-1.
- 4. Halliburton Reservoir Services (HRS) support in preparation for and execution of the test was substandard. Difficulties were experienced related to poor tool/TCP assembly and running procedures, lack of preparation and maintenance of tool string talleys, rupture of a downhole bypass tool, failure of the separator backpressure regulator system and two bottom-hole sampler misruns. These difficulties should be fully rectified and explained by HRS before using them on further Esso/ECI well tests. Both electronic and mechanical downhole samplers should be available in the future, which are not mercury-displaced, to be run by competent sampling staff onsite.
- 5. The HRS Memory Gauges successfully executed 12 out of 12 runs with good gauge repeatability. These gauges can be considered for use in future well testing operations within EAL. Esso affiliates have used them several times with excellent results.
- 6. Running of the LPR-N gauge in the well in the open position did save considerable time and allowed the tubing to be later filled with diesel in an expeditious manner. This technique can be considered for future well testing operations and can result in safer operations in some cases.
- 7. Running a welltest with the downhole shut-in LPR-N valve also enabled the collection of excellent reservoir data, almost completely removing wellbore storage effects in this volatile oil system. Its use should be considered for future welltests where wellbore storage may interfere with test interpretation.
- 8. Underbalanced TCP operations gave excellent perforations results using the pressure activated firing heads. This system should be considered for future wells executed, regardless of rig type.
