

Figure 6: Sample 27 (189.5 m): Plain (upper) and cross-polarised (lower) photomicrographs of litharenite. Fractures result from impact-damage. Note abundant ductily deformed lithic grains (L). Porosity (light blue) is partly occluded by kaolinite and difficult to estimate due to sampling-induced changes in grain packing. Long axis of photomicrograph is equal to 2.72 mm.
