Dear Sir,

Core Laboratories Intermediate Extended Service Well Logging Unit FL 802 was in use during the drilling of KAHAWAI No. 1 from surface to a total depth of 2320 metres.

Please find enclosed the IES well report, appended drilling parameter logs and the Corelab grapholog for your reference.

We appreciated being of assistance during the drilling operations and look forward to continuing our association on future wells.

If you require clarification of this report, please do not hesitate to contact us.

Yours very truly,
CORE LABORATORIES AUSTRALIA Ltd.

A. DODSON
Unit Supervisor

Signed by  in A. Dodson's absence

1. INTRODUCTION

KAHAWAI No.1 was drilled by ESSO Australia Ltd. in the Bass Strait, Australia.

Well co-ordinates were:

Latitude : 38° 10' 20.85" S
Longitude : 148° 22' 8.17" E

The well was drilled by South Seas Drilling Company's semi-submersible rig "Southern Cross", and monitored by Core Laboratories Intermediate Extended Service Field Laboratory 802.

KAHAWAI No.1 was spudded on 26 May 1982 and reached a total depth of 2320 metres on 11 June 1982, a total drilling time of 17 days. The main objective of the well was to assess the hydrocarbon potential of an erosional high beneath the Tuna-Flounder channel. The secondary objective was to delineate the western extent of the Tuna M - 1.2 reservoir.

Elevations were:

Kelly bushings to mean sea level	:	21 metres
Water depth	:	61 metres
Kelly bushings to mud line	:	82 metres

All depths used in this report and accompanying logs refer to depth below rotary kelly bushings (RKB).

Core Laboratories personnel involved in the logging of KAHAWAI No.1 were as follows :

A. Dodson	-	Unit Supervisor
G. Munn	-	Pressure Engineer
B. Giftson	-	Logging Crew Chief
B. Paulet	-	Well Logger
M. Kinder	-	Well Logger
B. Martin	-	Well Logger
M. Robinson	-	Sample Catcher
A. McCausland	-	Sample Catcher
P. Denton	-	Sample Catcher
A. Bock	-	Sample Catcher

2. CORE LABORATORIES EQUIPMENT

Core Laboratories Field Laboratory 802 monitoring equipment includes the following :

A. MUD LOGGING

- 1.T.H.M. total gas detector and recorder
- 2.Hot wire total gas detector and recorder
- 3.F.I.D. (Flame Ionization Detector) chromatograph and recorder
- 4.Gas trap and support equipment for the above
- 5.Rate of Penetration recorder and digital display
- 6.Pit volume totalizer,display and recorder
- 7.Digital depth counter
- 7.Two integrated pump stroke counters,with digital display
- 9.Ultra-violet fluoroscope
- 10.Binocular microscope

B. INTERMEDIATE EXTENDED SERVICE PACKAGE

- 1.Hewlett Packard 9825T desktop computer and 3497A data aquisition unit
- 2.Hewlett Packard 9872B plotter
- 3.Hewlett Packard 2631A printer
- 4.Two Hewlett Packard 2621P visual display units,(one located in the client's office)
- 5.Hookload/weight on bit transducer and recorder
- 6.Rotary speed tachogenerator and recorder
- 7.Standpipe pump pressure transducer and recorder
- 8.Mud flow out sensor and recorder
- 9.Mud temperature sensors and recorder (in and out)
- 10.Mud conductivity sensors end recorder (in and out)
- 11.Rotary torque sensor and recorder
- 12.Shale density apperatus
- 13.Hydrogen sulphide gas detector
- 14.Carbon dioxide gas detector

3. CORE LABORATORIES MONITORING EQUIPMENT

DEPTH

Depth registered every 0.2 metres and rate of penetration calculated each metre (or every 0.2 m while coring). ROP displayed on digital panel and chart.

WEIGHT ON BIT

A Tyco 0-1000 psi,solid state pressure transducer is connected to the rig's deadline anchor.The weight on bit is calculated in the Rig Functions panel, and displayed (with hookload) on a digital meter and recorder chart

ROTARY SPEED

This is a DC generator for which 1 volt = 100 rpm, and which is belt-driven from the rotary drive shaft.The value is displayed on digital meter and recorder chart.

PUMP PRESSURE

This is a Tyco 0-5000 psi transducer mounted on the standpipe manifold. The pressure is displayed on digital panel meter and recorder chart.

PIT VOLUME

Six individual pits can be displayed on the meter.The pit volume total is calculated in the PVT panel and displayed on a digital meter.The sensors are vertical floats driving potentiometers accurate to +/- 1 barrel.Each sensor is equipped with a wave compensating device. In addition a sensor is fitted to the rig's trip tank, so that hole fill-up during trips may be closely monitored.A recorder chart displays the levels of the active pits, the pit volume total ,and the trip tank.

PUMP STROKES

These are the limit switch type, counting individual strokes.The Pulse Data Box can monitor one or two pumps individually or integrate the total number of strokes from both pumps.The pump rate per minute is displayed on recorder chart.

ROTARY TORQUE

An American aerospace Controls bi-directional current sensor is clamped over the power cable of the rotary table motor. Torque is displayed on digital panel meter and recorder chart.

MUD TEMPERATURE

This is a platinum probe resistance thermometer, calibrated 0-100 deg.C. Temperature in and out is displayed on recorder chart and digital meter.

MUD CONDUCTIVITY

A Balsbaugh electrode-less conductivity sensor measures the current in a closed loop of solution coupling a pair of toroidal transformer coils.

The conductivity in and out is displayed on analog and digital meters, and recorder chart.

All the sensors are 5 to 24 v DC powered with the exception of the air driven gas trap. Along with monitoring and maintaining the above equipment ,Core Lab furnished and operated certain other items.

CUTTINGS

Microscopic and ultra-violet inspection of cuttings samples at predetermined intervals. Dry samples were washed, dried and boxed. Wet samples were washed sacked and boxed. Geochemical samples were canned and boxed.

GAS

1. Flame Ionization Total Hydrocarbon gas detector.
The T.H.M. accurately determines hydrocarbon concentrations up to 100% saturation.

2. Flame Ionization Detector chromatograph.
The F.I.D. is capable of accurate determination of hydrocarbon concentration from C1 to C6+.

3. Hot wire gas detector(Wheatstone Bridge type)
A back up system for total gas detection.

SHALE DENSITY

Manual determination of shale density in an accurately calibrated variable density column.

4. INTERMEDIATE EXTENDED SERVICE INTRODUCTION

The Core Laboratories Intermediate Extended Service Package includes sensors, recorders and computer facilities useful in the drilling operation; for the detection of abnormal formation pressure; and the optimization of drilling.

Presented graphically on Core Laboratories I.E.S. logs (discussed individually in the following section of this report) are the various functions necessary for well control, abnormal formation pressure detection and drilling optimization.

Other available services include electric log interpretation programs for the wellsite geologist, hydraulics (synthesis and analysis), well kill, cost per foot, bit nozzle selection, swab and surge created by pipe movement and bit performance programmes for the wellsite drilling engineer.

Core Laboratories I.E.S. logs include the following :

I.E.S. PRESSURE LOG

Information plotted on this log includes formation pore pressure, mud weight in and formation fracture pressure. This is plotted on linear graph paper at a vertical scale of 1:5000. The formation pore pressure and fracture pressure gradients are based on all available information. This is a conclusion log, therefore the information may be modified by results from formation drill stem tests, data from adjacent wells, kicks, and formation breakdown tests.

CORELAB DRILL DATA PLOT

This plot, which is drawn while drilling is in progress, is the primary tool by which formation overpressure is detected. Drawn on a 1:5000 scale it is particularly useful in that five plots are drawn side by side, and thus any trend can be readily recognised.

The main plot is that of the corrected 'd' exponent, which is presented on a logarithmic scale. The 'd' exponent was first developed by Jorden and Shirley in 1966 to assist in interpreting rate of penetration data by normalizing for rotary speed and weight on bit per inch of bit diameter.

The modified 'dc' exponent was proposed by Rhem and McClendon to compensate for increases in mud weight. This involves multiplying the standard 'd' exponent value by the inverse ratio of the mud weight. A multiple of 9 ppg was used for convenience to return the magnitude of the 'dc' to a comparable value of its uncorrected state. In this case, a multiplier of 10 ppg was used. The equation for 'dc' is therefore :

$$\text{"dc"} = \frac{\text{Log} \left(\frac{\text{ROP}}{(\text{RPM} \times 60)} \right)}{\text{Log} \left(\frac{(\text{WOB} \times 12)}{\text{Bit diam} \times 1000} \right)} \times 10$$

Deviations from the normal "dcs" trend may be interpreted as being due to a change in formation pore pressure. An equation derived by Eaton is used in an attempt to evaluate pore pressure form deviations in the "dcs" plot. This method of overpressure detection can be fairly accurate for homogeneous shales, but where the sand/silt/shale ratio varies a great deal, inaccuracies often occur.

The other main plots are a logarithmic rate of penetration, which complements the 'dcs' plot and a linear plot of total mud gas.

Shale densities are also plotted on a linear scale in order to show up a decreasing density trend, and hence a possible transition into abnormally pressured shales. The points are determined by measuring the density of air dried shale samples in an accurately calibrated density solution.

An interpreted lithology column is also included on the log, as is a plot of mud density in, to assist in interpretation. All relevant information, such as casing points, bit runs, etc. are also included.

I.E.S. GEO- PLOT LOG

This is plotted by the computer while drilling is in progress. At a later date this plot can be re-run on different scales to suit the client. The data is stored on magnetic tape during the drilling operations. Functions plotted on this log are : rate of penetration, corrected "d" exponent, break-even analysis, formation pore pressure, mud density in and formation fracture pressure. Two Geo-plots are included in this report, at scales of 1:2000 and 1:5000.

I.E.S. FLOWLINE TEMPERATURE, FLOWLINE TEMPERATURE END TO END PLOTS

Flowline temperature and end to end plot of flowline temperature are the two main plots relating to the temperature of the returning drilling fluid. These are plotted on a vertical scale of 1:5000. The use of these plots as an indicator of the presence of over-pressure takes secondary role to the I.E.S. drill log. Continuous observation of flowline temperature may indicate an increase in geothermal gradient. Factors affecting temperature are noted on the log, such as new bit runs, changes in the circulation rates, circulating cuttings out and the addition of water and chemicals to the active mud system. Since the goal of the end-to-end plot is to provide a representation of the geothermal gradient, all surface changes which would cause artificial changes in the flowline temperature are disregarded.

ELECTRIC LOG PLOT

A plot of shale resistivity (ohm-metres squared/metre), sonic travel time (microseconds per foot), bulk density (gm./cc) and neutron porosity (%), is made, using data supplied by Schlumberger. Two-cycle semilog paper is used, with a vertical scale of 1:10,000. As far as possible only clean shale points are selected and plotted. The relatively compressed vertical scale makes deviations from the normal compaction trend easier to identify.

PROGRESS LOG

This is the traditional presentation of footage against elapsed time in days. It shows actual drilling time from spud to total depth.

DATA RECORDING

Data is recorded on tape while drilling both as raw input numbers and computer calculated numbers. This data can be accessed later for use in interpretative programs or to review data. Comprehensive data lists are included in this report.

MUD DATA SHEETS

These are a record of the mud properties while drilling and are derived from the mud engineer's daily report.

DRILLING PARAMETER PLOT

The drilling parameter plot shows : rate of penetration, weight on bit, rotary speed, pump pressure, hydraulic horsepower, impact force and jet velocity. This plot is drawn by the computer and is designed to aid the drilling engineer in drilling optimization. The scale chosen here is 1:5000.

HYDRAULIC ANALYSES

During drilling, routine hydraulic analyses are calculated by the computer, and these are made available to the drilling engineer. This report includes a sample hydraulics for each 100 m.

GAS COMPOSITION ANALYSIS

For each significant gas show, the chromatograph results are analysed using two techniques:-

1. Log plot
2. Triangulation plot

Both plots are included in this report.

GRAPHLOG

This is plotted on the industry standard form on a vertical scale of 1:500. Rate of penetration is plotted in metres per hour, together with mud gas chromatography results. Total gas is also plotted, and a percentage lithology log is drawn. A lithology description is presented in an abbreviated form. All relevant drilling data is included, as is bit and mud data.

MISCELLANEOUS

Various data collected from this well are also included in this report for reference. These include formation leak off test data, and R.F.T. and well test data where appropriate.

7. WELL HISTORY

WELL HISTORY KAHAWAI No.1.

- 23/5/82 Commenced tow to KAHAWAI No.1 location, at 22:00 hrs.
- 24/5/82 Towed to KAHAWAI No.1 location.
- 25/5/82 Towed to KAHAWAI No.1 location. Dropped first anchor at 10:16 hrs. Ran anchors and pretensioned to 200000 Klbs. Ran the T.G.B. ; landed at 24:00 hrs.
Final position: $38^{\circ} 10' 20.85''$ S.
 $148^{\circ} 22' 8.17''$ E.
R.K.B. to M.L. 82m; Water depth 61m.
- 26/5/82 Made up the 26" hole B.H.A. and spudded in at 03:30 hrs. Drilled from 82.5m to 216m with RR No.1 + 26" H.O. Returns to seabed. Flushed the hole at 216m with hi-vis mud, and dropped the D.S. tool. P.O.O.H. to H.W.D.P. and retrieved the survey tool: 216m, $\frac{3}{4}^{\text{D}}$. P.O.O.H. Moved the P.G.B. to the spider beams and ran the 20" casing.
- 27/5/82 Made up the stinger and landed the P.G.B. Rigged up the cement unit and cement lines, but could not circulate. P.O.O.H. made up a B.H.A and R.I.H. drilled out the 20" shoe. P.O.O.H. made up the stinger and ran in. Checked for returns with the T.V. Pumped cement and displaced with 18bbl sea water. W.O.C for 5 hrs, and P.O.O.H. Prepared to run the B.O.P.
- 28/5/82 Ran the L.M.R. and B.O.P. Nippled up and set the wear bushing. Ran the riser alignment tool. Made up the B.H.A and function tested the diverter. Ran in the hole with RR 1 ($17\frac{1}{2}$ "'). Drilled the cement and washed to 216m. Drilled to 348m spotting Hi-vis pills as required. B.G. was around 30 ppm. C.G. was detected at 318, 329 and 339m.
- 29/5/82 Drilled from 348m to 806m with 4u B.G. Circulated out at 806m. The shakers were clean. Gas fell to under 1u after B/U. Dropped the survey tool, pumped a slug and started to P.O.O.H. The lithology whilst drilling had been gumbo but little drag had been found on connections. When pulling out tight hole was found between 793m and 544m, maximum O/P was 100Klbs. The calcilutite was hygroscopic, so it seems likely the clay particles swelled causing drag. Before P.O.O.H. a carbide test was dropped, it indicated a hole volume of 860 bbl at 806m (+ riser) ; indicating an in-gauge hole. Comparing this 860 bbl figure with the volume obtained using the caliper tool on 30/5/82.
- 30/5/82 P.O.O.H. to 19m (20" shoe) recovered the D.S. tool: 806m, $\frac{1}{4}^{\text{D}}$, R.I.H. and found $1\frac{1}{2}$ m fill. Circulated for $1\frac{1}{4}$ hrs. W.T.G. was 70u. Pumped a slug and P.O.O.H. with very little drag. Rigged up wireline tools and ran wireline logs Run No. 1 : BHC-GR-CAL-DIL. The sonic tool gave trouble and was re-run. the caliper tool gave a measured hole volume of 99.1 c.m, or 623bbl. This gives a calculated hole volume of:- Riser vol : 109 bbl
20" csg vol 156bbl
 $17\frac{1}{2}$ hole vol 623bbl
888bbl- this compares with an implied volume of 860 bbl from the carbide measurement. The volume from 791m to 333m (prop T.O.C) was 70.2 c.m or 441 bbl. Made up the running tool and 13.375" hanger. Made up the B.H.A. and ran in, 2m of fill was found. C.O. and found 10u T.G. Pumped a slug and P.O.O.H. (strapping out)

- 31/5/82 Continued to P.O.O.H., recoverde the wear bushing, rigged up and ran the 13 375" casing. Landed the string and rigged up the cement line. Started to circulate but found the head leaking. Repaired the head. Teated the cement lines and circulated with the cementing unit;- maximum gas was 10u. Cemented and bumped the plug with 1500p.s.i. Rigged down the cement lines, released the running tool and P.O.O.H. Washed insede the B.O.P. and set the seal assembly. Tested the B.O.P. -"OK". Set the wear bushing, made up the B.H.A. and R.I.H.- tagged the cement at 766m. Drilled through the cement plug.
- 1/6/82 Continued to drill the cement, and drilled from 806m to 812m with bit No.3, X3A, 12 $\frac{1}{4}$ ". At 812m a P.I.T. was carried out. After initial problems a presure of 600 p.s.i. was held for 5 min, with no leak off, giving a P.I.T. of 13.5 p.p.g. E.M.W. Drilled ahead to 1131m where the flow line had to be cleaned out as it was blocked with gumbo. The riser was flushed,drilled ahead to 1150m. B.G. was around 6u.
- 2/6/82 Drilled ahead to 1394m. The flow line unblocked at 1182m, and 1251m due to gumbo blockage. At 1395m a drilling break occured. The R.O.P. increased from around 15 m/hr to 80 m hr. B.U were C.O. The maximum gas observed was 52u. A minor quantity of sand stone was found but no fluorescence was detected. A further 2m was drilled to 1396m B.U were C.O. and 150u of gas was detected. A greater percentage of sandstone was found, but no fluorescence was detected. It was decided to cut a core, the survey tool was droped;- misrun.
- 3/6/82 P.O.O.H. and run in with core bbl. B/U were then circulated and the maximum gas was 56 units. After spacing out and dropping the ball core No.1 was cut from 1396.4 to 1410.0m .Maximum gas while coring was 18 units @1397m and the interval 1400.6-1410m was not C.O. After P.O.O.H. (spin out chain) and retrieving the core, recovery was found to be 6.37m out of 13.6m cut, (48%). The bottom section showed good flu. in SST @ 1402.97m. After servicing core bbl., M/U core bbl. and RIH, picking up3 more DC. 5m of fill were found after RIH. B/U were again circulated (Maximum gas :44 units) and core No.2 was cut from 1410 to 1418.0m. Maximum gas while coring was 12 units from 1413m and the interval from 1417-1418.0m were not CO.,P.O.O.H.was commenced (chaining out).
- 4/6/82 Complete P.O.O.H. with Core No.2. Upon retrieval of the core, recovery was found to be nil out of 8m cut. The bit condition was found to be 100% worn. After laying down 30 singles of pipe (6"), BHA was made up and 30 singles of "E" pipe were picked up. RIH stopped at the casing shoe to fill the pipe then continued, reaming the cored interval 1396-1418m, before drilling 12 $\frac{1}{4}$ " hole ahead to 1426m. B/U were circulated after a drilling break at this depth (Max. gas observed was 38 units). Drilling continued to 1482m and B/U were again circulated, max. gas this time was 95 units. At 1545.2, B/U were circulated once more (Max. gas 15.0 units) and it was decided to cut core No.3 . A survey was drooped ($\frac{1}{4}^{\circ}$, 70° NW) and P.O.O.H. laying down 32 singles of "6" pipe. (Tight hole was found from 1469-1464m). BCO was 5-3-/8. The core bbl. was made up and RIH commenced
- 5/6/82 RIH continued, picking up 32 singles of "E" pipe and after spacing out and circulating B/U (max gas was 14 units) core No.3 was cut from 1545.2 to 1558.2M Maximum gas while coring was 13.7 units, from 1548.8M. The interval 1553.6 to 1558.2 was not C.O. After P.O.O.H to retrieve the core; recovery was found to be 10.95M out of 13M cut (84%). After a rig service, R.I.H to shoe and break circulation to fill pipe before completing R.I.H. Reamed the cored interval, then continued to drill 12 $\frac{1}{4}$ " hole.
- 6/6/82 Drilling continued to 1632M where a drilling break was flow checked (NO Flow). After circulating B/U (maximum gas 2.4 units) the well was drilled ahead to 1671M. Generator problems then forced circulation with only one pump, drilling stoped but the string was kept rotating.

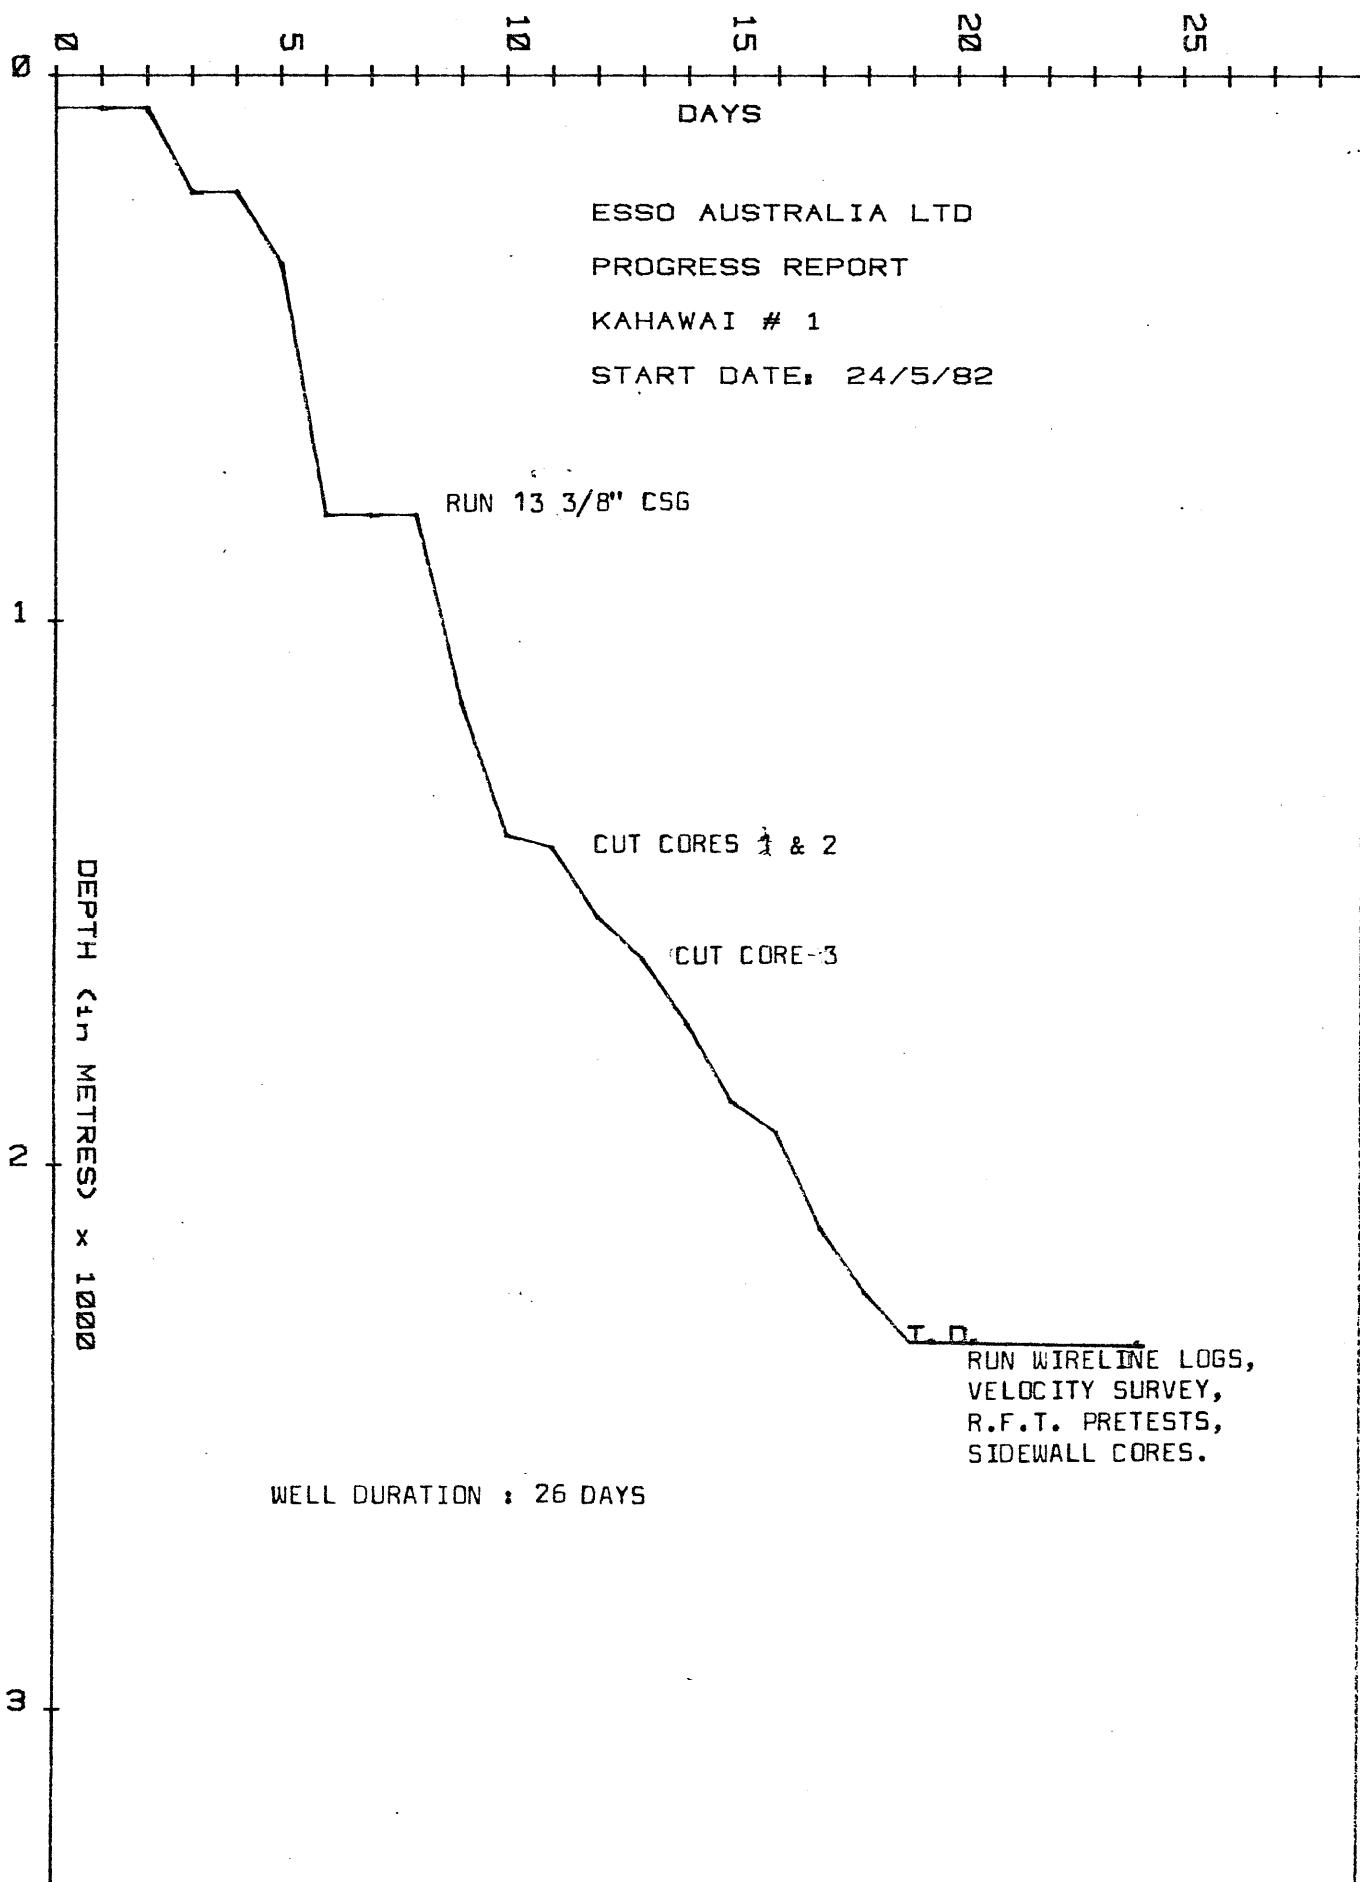

Drilling then proceeded to 1738M where reduced R.O.P resulted in the decision to change the bit. B/U were circulated and a survey dropped prior to P.O.O.H (laying down 10 singles of 6" drill pipe). The survey upon retrieval was $1^{\circ}N$, $89^{\circ}E$. After R.I.H B/U were circulated (max gas was 21u). Drilling continued.

- 7/6/82 Drilled $12\frac{1}{4}$ " hole to 1840M where a drilling break at 11.8 to 22M/hr was C.O maximum gas observed at B/U was 1.3 units. Drilling continued with decreasing R.O.P and high torque problems.
- 8/6/82 Drilled $12\frac{1}{4}$ " hole to 1884M, where it was decided to change the bit due to low R.O.P and recurring high torque problems. P.O.O.H to the shoe. 12 singles of 6" drill pipe were laid down and the drill line was slipped and cut. P.O.O.H. The B.C.O was $6-4-\frac{1}{8}$. Ran into the hole with W.B.R.T this however was hung up 30M into the riser. After washing to the well head, the wear bushing was finally retrieved. R.I.H with the B.O.P test plug, tested the B.O.P. P.O.O.H with the test plug, set the wear bushing and made up a new B.H.A, M/U and R.I.H to the shoe, the pipe was filled and the drill string hung off for service to the rig. Reaming was necessary at 1778M. Trip gas was 30.0 units. Resumed drilling, reaching 1940M by midnight. Observed gas peaks of 5.4-31-9.5 units at 1916M and 4.4-51-7.0 units at 1924M, due to coal.
- 9/6/82 Drilled ahead to 1950M, where a short rig service was necessary before drilling ahead. A gas peak of 44.5 units was observed at 2082M and regions of high torque experienced at 2103 and 2114M.
- 10/6/82 A 12 stand wiper trip was deemed necessary at 2115M up to 1754M. As drilling resumed T.G was 11-34-12 units. A gas peak of 3-68-7 units was observed at 2220M, due to coal. Experienced intermittent and erratic torque from 2161M onwards.
- 11/6/82 Drilling continued to 2256M where a 6 stand wiper trip was conducted, no drag encountered. Upon returning to the bottom, T.G was 2-4-1.6 units. Drilled ahead to T.D of 2320M, reached at 22:45hrs, P.O.O.H commenced without C.O.
- 12/6/82 P.O.O.H to shoe, R.I.H tagging bridges at 2060M and 2147M which necessitated P/U the kelly and washing through each tight spot, 7M of fill were encountered. Circulated B/U to recover samples still in the annulus, T.G was 1.0/ 3.5/1.2 u A survey was then dropped and P.O.O.H commenced. The survey when retrieved was $3^{\circ}N$, $79^{\circ}E$. Schlumberger was then R/U but entering the hole the tool tagged a bridge at 1860M and reached only as far as 1881M. The interval 1881-970M was logged. (DDL-MSFL-GR-SP). Schlumberger then rigged down. R.I.H for a wiper trip, encountering tight hole at 1886 and 2060M, 7M of fill was found on bottom. A 70bbl hi-vis pill was pumped, B/U for the trip was 2.1-7.8-4.8 units, with a trace of CO₂ present during the circulation, peaking at 19% from 1860M. P.O.O.H using pipespinner until casing shoe was reached.
- 13/6/82 Schlumberger were rigged up and the following logs run:
DDL-MSFL-GR-SP (2315-1820m)
LDL-CNL-GR (2319-790m)
BHC-GR-SP (2313-790m)
Ran velocity survey taking readings between 500 and 2315m prior to running RFT No.1 .
- 14/6/82 Continued running RFT No.1 taking 24 pretests between 1394.5 and 2302m. The sampler then malfunctioned necessitating P00H to change probes and service the RFT tool. It was then decided to make a wiper trip, to maintain favourable hole condition, and RIH, 2m of fill were encountered. Circulating B/U trip gas 3/14.1/1.7 units. P00H then commenced using the pipespinner and once out Schlumberger ran RFT No.2, filling the 6 gallon chamber and 1 gallon segregator chamber @ 1403m, RFT No.3 was then run and sampled the formation @ 1393.5m.

- 15/6/82 Completing RFT No. 3, CST No's 1,2, and 3 were run. Recovering CST No.1, 51 shoes were taken but the failure of 18 shoes on run No.2 resulted in the decision to run CST No.3 with 30 additional shoes to be taken. Rigging down Schlumberger and after slipping and cutting the drill line RIH then commenced and cement plug No.1 was set from 2320 to 2220m using 230 SX of class "N" cement and 1.4% HR-6L in 31 bbls of mix water. POOH to 1960m and circulating, plug No.2 was then set from 1960-1860 using 250 SX of "N" cement and 1% HR6L in 31 bbls of mix water. Pulling back to 1800m procedure was then to W.O.C. and circulate. Slurry Wt of cement was 15.6 ppg.
- 16/6/82 While WOC, 33 more joints of drill pipe were layed down. POOH to 1450m the third plug was set from 1450m to 1335m using 323SX of class "N" cement mixed with 40 bbls of mix water. POOH 1300m and circulating the hole clean. POOH continued to 840-740m. Pulling back to 690m the hole was circulated clean and then more pipe layed down. Rigged up Schlumberger and 13⁷/₈" 6R-JB-CCL. Tested shear rams and cement plug No.4 to 1000psi. Schlumberger ran in and set a 13⁷/₈" EZSV bridge plug @335m. After M/U and running the perforating gun between 158 and 159m (3 runs were required before an injection rate could be established), Schlumberger ran and set a 13⁷/₈" EZSV retainer @ 149m and R/D. M/U stinger and RIH, then sting into retainer, and squeeze 310 SX and soot 100 SX on top of retainer. POOH to 104m and reverse circulate. POOH
- 17/6/82 Displaced the riser. Layed down D.P. and recoveree the L.M.R. & B.D.P. Deballasted and ran the shot can, shot the charge at 20:20 hrs. Ballasted the rig down.
- 18/6/82 Jumped divers and hooked the slings to the guide base. Recovered the T.G.B. & P.G.B. Started to recover the anchors.
- 19/6/82 Recovered the anchors. Recovery was complete at 12:00 hrs.

WELL DURATION : 22:00 hrs 23 MAY '82 - - - 12:00 hrs 19 JUNE '82
: 26 DAYS 14 hrs.

REMARKS:

11. LITHOLOGICAL SUMMARY

LITHOLOGICAL SUMMARY

At the time of printing the depths of the formation tops were not available.

The main objective of the well was to assess the hydrocarbon potential of reservoir sandstone in the Latrobe Formation.

GIPPSLAND LIMESTONE

The top of the formation consisted of carbonate material being mostly shell fragments with some fossils. Below, the limestone encountered was a calcilutite. It was light gray to medium gray, mostly soft, with shell fragments and abundant fossils, including foraminifera, bryozoa and corals. Gumbo was occasionally encountered. Occasional appearance of clear to opaque sandstone being fine to medium grained, sub-angular to sub-round and predominantly unconsolidated.

LAKES ENTRANCE FORMATION

Siltstone was encountered throughout the formation. This was medium to dark gray, occasionally pale brown, mostly blocky, some sub-fissile, slightly carbonaceous in part. A light gray, soft material was also observed and classified as marl. Traces of glauconite were detected in the siltstone below 1300 metres.

GURNARD FORMATION

This was comprised of siltsone and sandstone. The siltstone was medium to dark gray, soft to firm, blocky to sub-fissile, calcareous and slightly carbonaceous, with traces of glauconite. The sandstone was tan to brown, soft, medium to coarse grained, glauconitic, with a silty brown matrix.

LATROBE FORMATION

This formation consisted of interbedded sandstone, siltstone and coal. Sandstone was clear to frosted, coarse grained, sub-round, moderately well sorted, loose, with traces of mica and pyrite. Siltstone was predominantly brown, occasionally shades of gray, blocky to sub-fissile, firm to moderately hard, often very carbonaceous and occasionally micaceous. Coal was black, moderately hard, occasionally hard, brittle and mostly vitreous. Maximum gas was 193 units and was attributed to coal. However an RFT at 1403 metres recovered a dark golden-brown, petrol smelling hydrocarbon fluid (ie. see RFT data in this report).

Three cores were cut, but only two were recovered, these being between the depths of 1400 metres and 1420 metres. A full core description may be found on the tail sheet of the grapholog.

12. OVERBURDEN GRADIENT CALCULATIONS

DEPTH Metres

BULK DENSITY gm/cc

OVERBURDEN PRESSURE INCREMENT . psi

CUMULATIVE OVERBURDEN PRESSURE . psi

OVERBURDEN PRESSURE GRADIENT . psi/ft

OVERBURDEN EQUIVILANT DENSITY . Pounds per gallon

BULK DENSITY TAKEN FROM AVERAGED F.D.C. LOG, OR FROM SONIC LOG
FOR SECTIONS WHERE THE F.D.C.LOG IS NOT AVAILABLE.

=====

Straight Line Least Squares Best Fit

1/Time on a linear scale against Temperature on a linear scale
(where time is the hours elapsed since circulation stopped)

Entered Data: (From Wireline Logs)

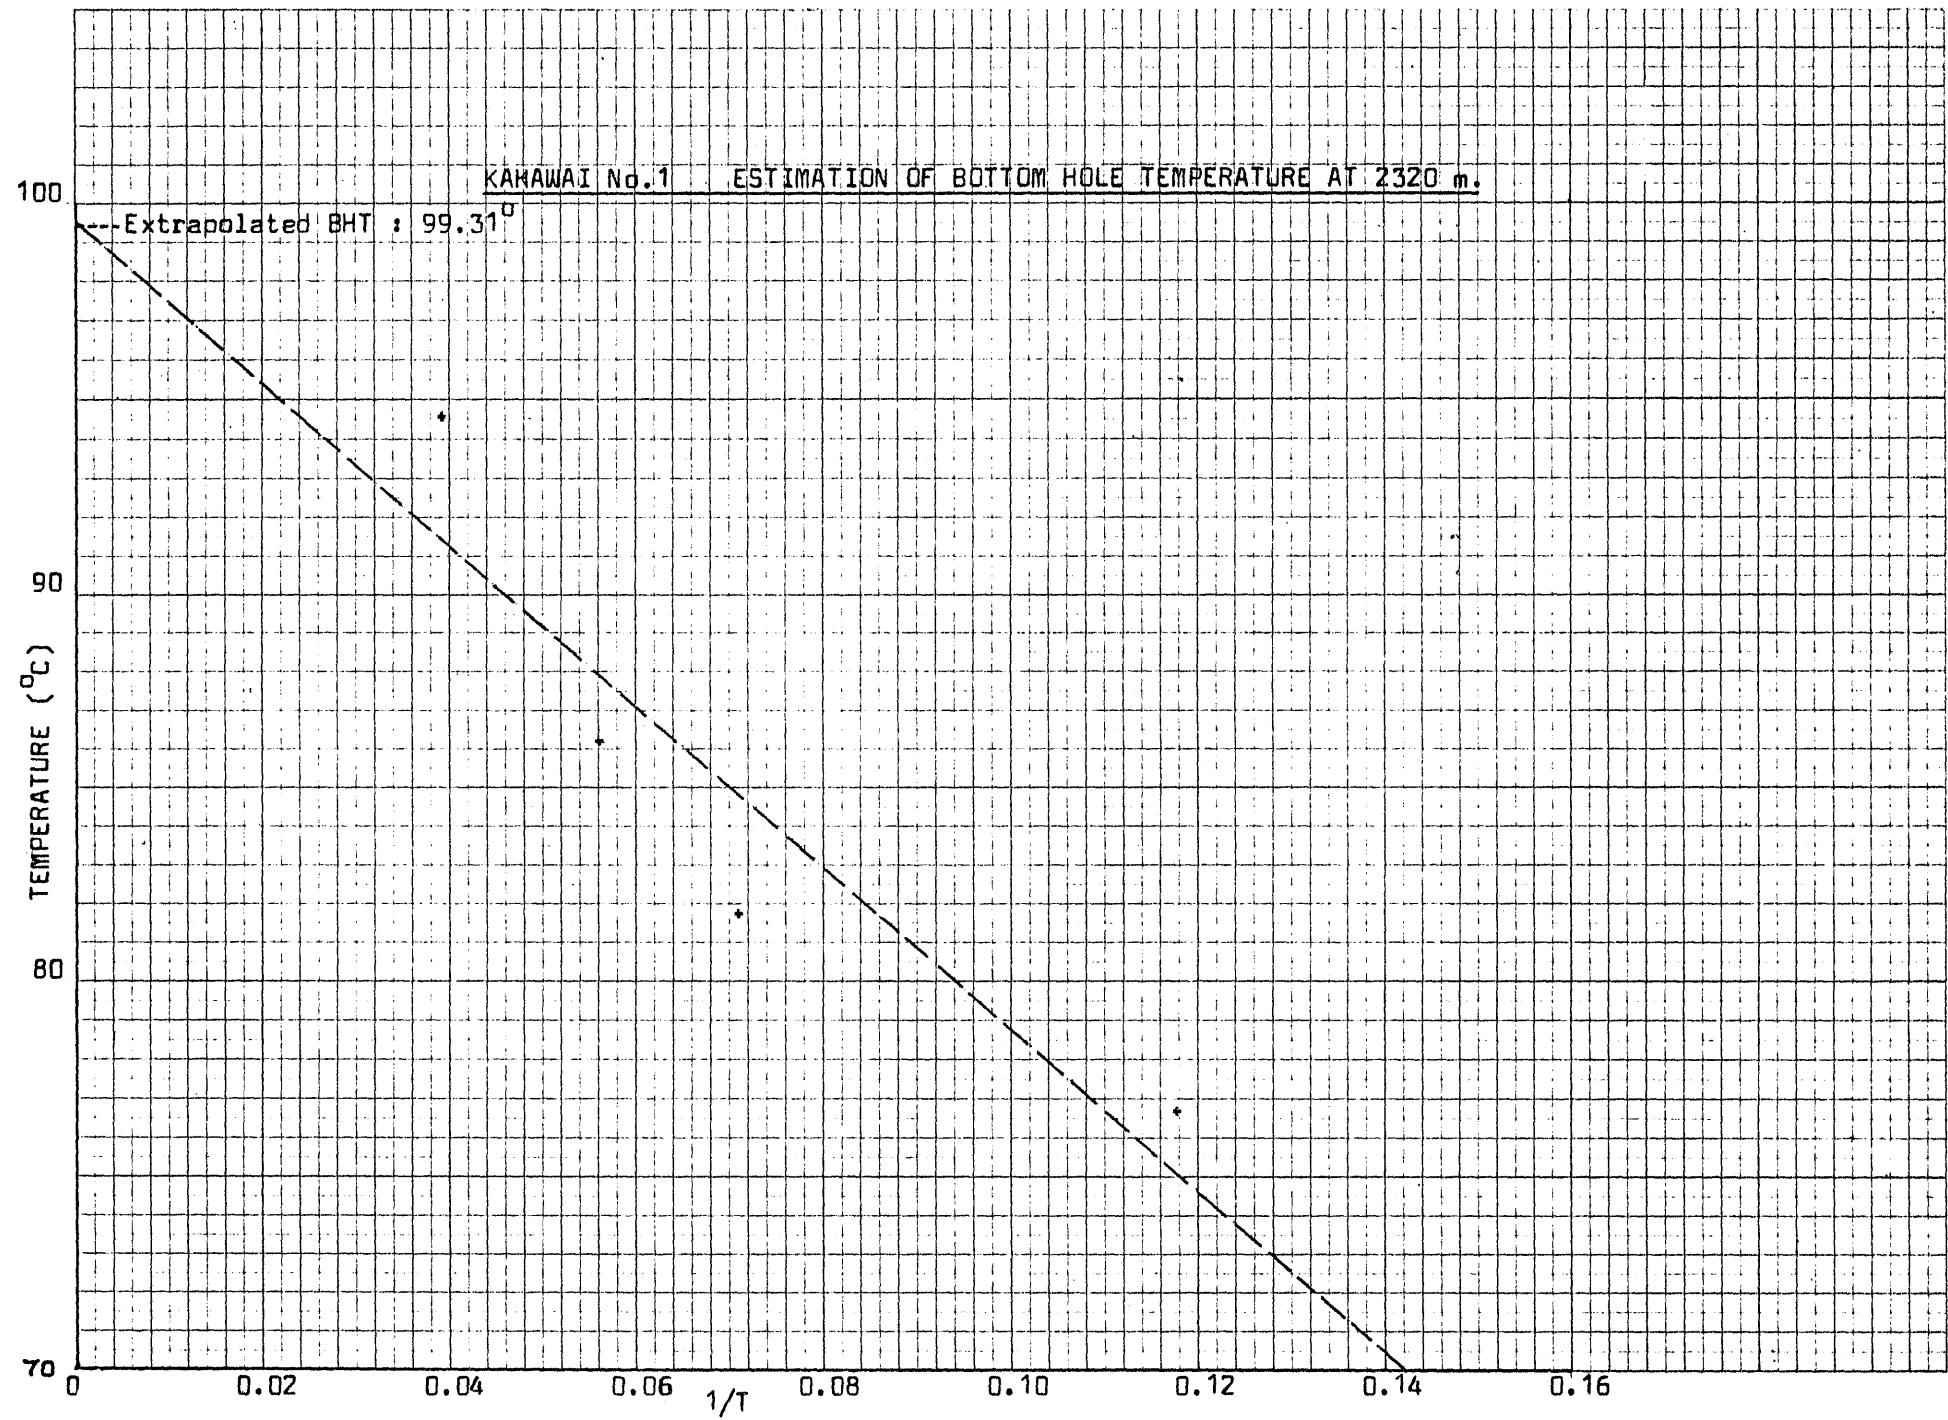

<u>DATA SET #</u>	<u>1/TIME</u>	<u>TEMPERATURE (°C)</u>	<u>TIME (HRS)</u>
1	0.418	76.67	8.5
2	0.071	81.67	14.0
3	0.056	86.11	18.0
4	0.039	94.44	25.5

Coefficient & Constant:

$y = m \cdot x + c$ where $m = -2.0539040E-02$ and $c = 9.9305218E+01$

Interpolated Data:

<u>1/TIME</u>	<u>TEMPERATURE</u>
0.000	99.31

15. SIDEWALL CORE GAS ANALYSIS

CORE LAB

SIDEWALL CORE GAS ANALYSIS DATA SHEET

SHEET # 1

COMPANY ESSO AUSTRALIA

WEI KAHAWAI NO.1

16. GAS COMPOSITION ANALYSIS

The composition of entrained reservoir gas in the mud is significant in determining the origin and the value of a show. Two graphical methods are employed for processing the mud gas chromatography results. These techniques however are empirical and by no means definitive.

LOG PLOT

The ratios of C₁/C₂, C₁/C₃, C₁/C₄, C₁/C₅ and C₁/C₆ are plotted on three-cycle log paper for each hydrocarbon show. The plots can be evaluated by the following criteria :

1. Productive dry gas zones may show only C₁, but abnormally high shows of C₁ are usually indicative of saltwater.
2. A ratio of C₁/C₂ between approximately 2 and 15 indicates oil and between 15 and 65, gas. If the C₁/C₂ ratio is below about 2, or above about 65, the zone is probably non-productive.
The actual values of the gas/oil/water limits will vary from area to area.
3. If the C₁/C₂ ratio is low in the oil section and the C₁/C₄ ratio is high in the gas section, the zone is probably non-productive.
4. If any ratio (with the exception of C₁/C₅, if oil is used in the mud) is lower than the preceding ratio, the zone is probably non-productive.
5. The ratios may not be definitive for low permeability zones; however, steep ratio plots may indicate a tight zone.

TRIANGULATION PLOT

The triangular diagram is obtained by tracing lines on three scales at 120 degrees to each other, corresponding respectively to the ratios of C₂, C₃ and normal C₄ to the total gas (C₁ to nC₄). The scales are arranged in such a way that if the apex of the triangle is upward, a gas zone is indicated, while if the apex points downward, an oil zone is suggested.

A large triangle plot represents dry gas or low GOR oil, while small triangles represent wet gases or high GOR oils. The homothetic centre of the plot should fall inside the top part of the triangle, otherwise the heavier hydrocarbon is abnormal and may indicate a dead show, (or coal gas).

GAS COMPOSITION PLOTS

- 1396.0m : This plot was taken from drill gas readings taken while drilling with bit No. 3. A drilling break occurred between 1394m and 1396m. A gas peak of 150u was recorded from 1396m. Bit No. 3 was pulled at 1396m, and core No. 1 was cut from 1396.4m. The plot indicates a wet gas zone at 1396.0m, with probable fair to good permeability.
- 1397.0m : This plot was taken from gas readings taken while drilling core No. 1. The plot indicates wet gas. When the core was recovered no fluorescence was observed from 1397m.
- 1397.4m : This plot is again from a zone cut during core No. 1. The plot indicates a wet gas reservoir fluid.
- 1397.8m : This plot was taken from gas readings taken while cutting core No. 1. The plot indicates gas; - slightly dryer than at 1397.0m and 1397.4m. The lithology at this depth was a fine sandstone : dark grey/black, firm to hard, micaceous, carbonaceous. The sandstone showed no fluorescence.
- 1410.0m : This plot was taken from gas readings taken while cutting core No. 2. (The gas from the interval cut by core No. 1 was not fully circulated out.) This plot indicates a reservoir fluid of very wet gas or high G.O.R. oil. It may indicate a possible gas/oil contact.
- 1411.0m : As above this plot indicates a reservoir fluid of very wet gas or high G.O.R. oil.
- 1412.0m : As above this plot indicates a reservoir fluid of very wet gas or high G.O.R. oil.
- 1413.0m : This plot, - taken while cutting core No. 2 as above, indicates a reservoir fluid of wet gas, or possibly high G.O.R. oil. The plot indicates a slightly dryer fluid than that indicated from 1410.0 to 1412.0m.

1414.0m : This plot indicates a reservoir fluid of wet gas or high G.O.R. oil.

1415.0m : This plot, taken from an interval cut by core No. 2, indicates a reservoir fluid of very wet gas or high G.O.R. oil. The plot being on the border point of oil and gas.

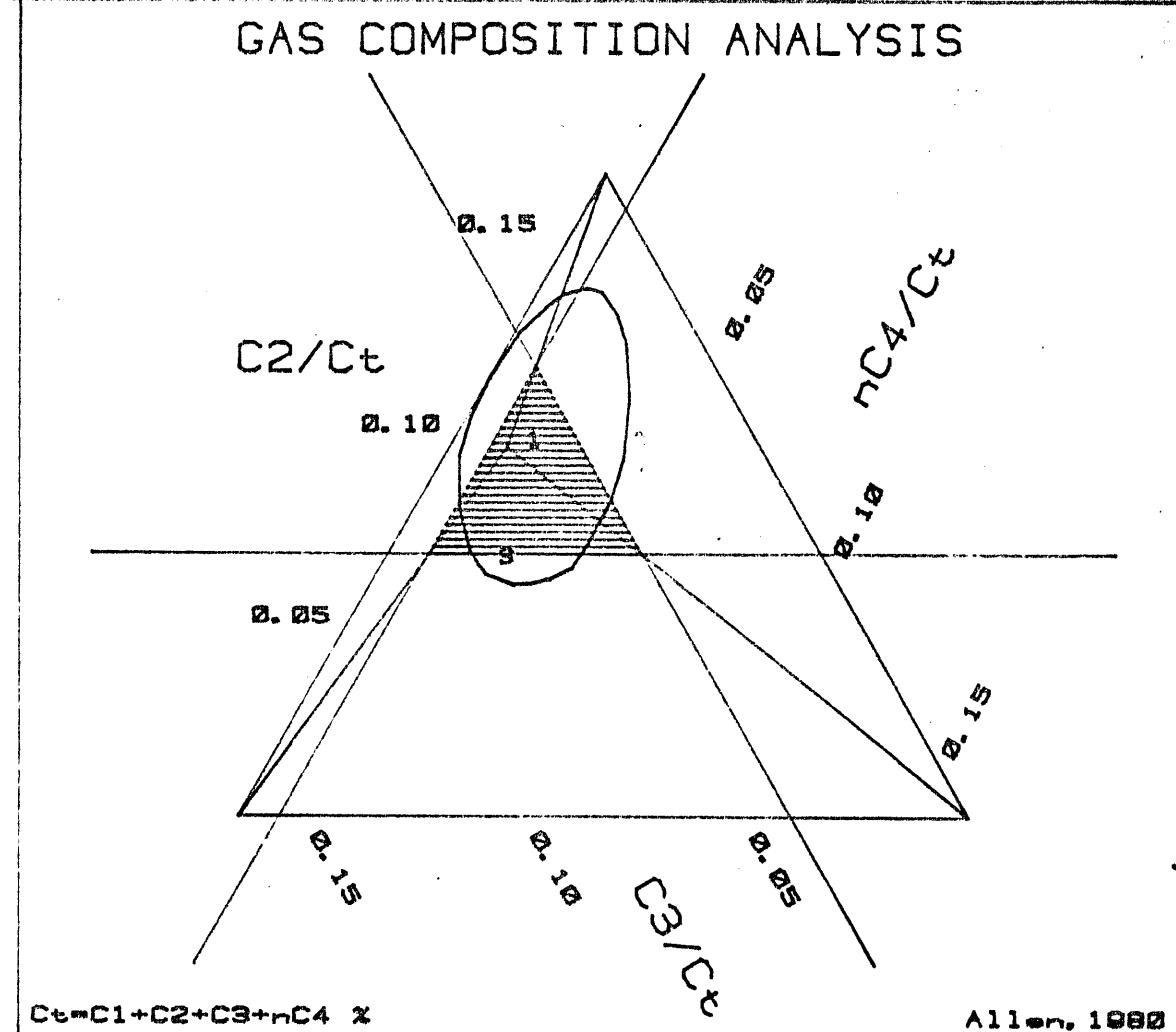

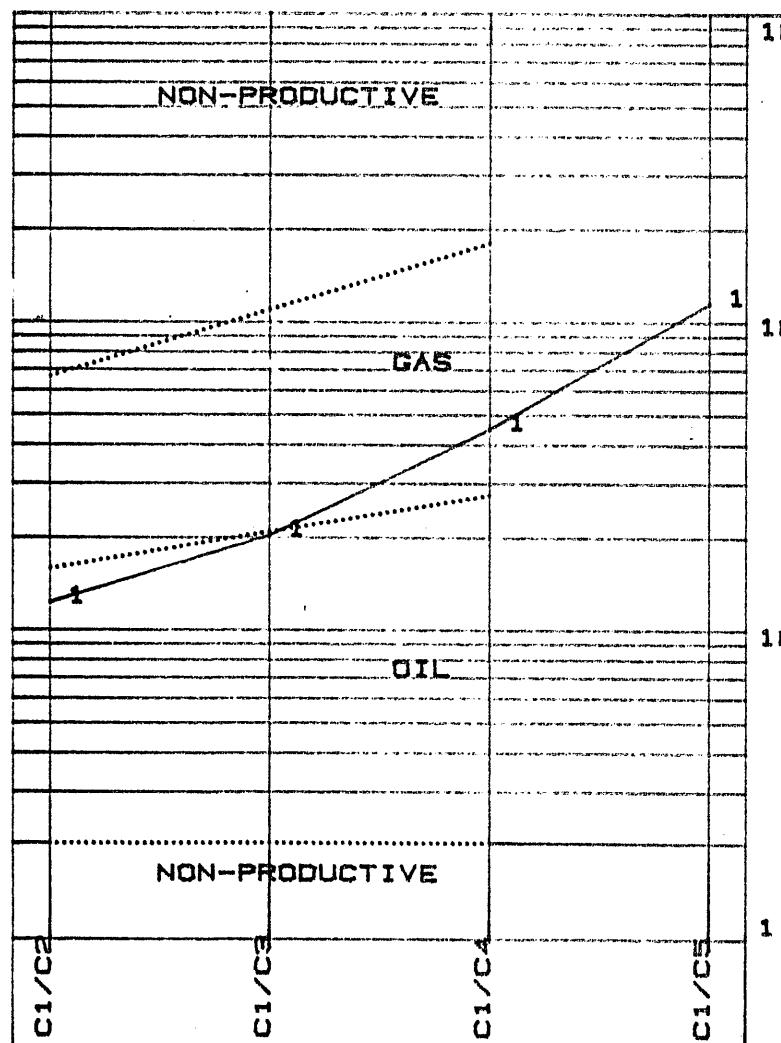

1416.0m : This plot indicates a reservoir fluid of wet gas. Surprisingly the fluid is indicated as being 'dryer' than that indicated at 1410.0 to 1415.0m.

1417.6m : This plot-taken from the last gas readings taken while cutting core NO. 2, indicates a reservoir fluid of wet gas; - as at 1416.0m. (The gas from the interval cut by core No. 2 was not fully circulated out whilst the core was being cut.)

18. PORE PRESSURE SUMMARY & P.I.T. DATA

PORE PRESSURE AND FRACTURE GRADIENT SUMMARY

KAHAWAI No. 1 was drilled in the Gippsland Basin region of the Bass Strait. It was correctly thought that this basin is normally pressured and abnormal pressure was therefore not expected. Core Laboratories unit FL 802 monitored and calculated various parameters associated with pressure detection.

The DRILL DATA PLOT shows the d'c exponent trend. As can be seen from the plot a normal trend does not develop until around 700m. At this depth the calcarenite becomes more consolidated, and is no longer drilled by extrusion. Between 700m and 1380m a good trend is followed; - though the trend is a slight reversal to the normal pore pressure trend. This is due to the lithology; - the cleaner siltstone being easier to drill than the high clay content siltstone found shallower. This trend is normal for the Gippsland Basin Gippsland Limestone and Lakes Entrance formations. Between 1380m and 2320m the d'c exponent trend is completely scattered due to the predominance of sandstone in this section. No pressure interpretations can be made from the trend.

As can be seen from the plot the background gas varied between 1 u and 10 u., with peaks occurring at 1400m and 1490m to 1530m. The B.G. does not indicate an increase in the pore pressure. The mud density was increased from 8.7 p.p.g. to 10.0 p.p.g. before the Latrobe Group was penetrated; - to maintain a safety margin in the event of a gas cap in the target zone.

The TEMPERATURE PLOT does not indicate an increase in the pore pressure. An offset and a change in the geothermal gradient occurs at 630m; - this is due to a small sandstone bed. The estimated B.H.T. at 2320m was 99° C. The average geothermal gradient was 3.50 °C/100m. This value compares with 2.90°C/100m for TARWHINE No. 1, 3.50°C/100m for BREAM No. 4A, and 3.50 °C/100m for PALMER No. 1.

The PRESSURE PLOT shows the conclusions on the pore pressure for KAHAWAI No. 1. The quantitative data for this plot is from the results of the R.F.T. runs.

The fracture gradient on the PRESSURE PLOT is derived from the one P.I.T. carried out at the 13 3/8 " shoe. As such it is a conservative estimate of the gradient, however in the absence of further data it is the best that can be obtained. The shape of the curve is derived from the gradient for the U.S. Gulf Coast area, and offset to match the KAHAWAI No. 1 data. (overburden gradient and P.I.T. data)

19. COMPUTER DATA LISTINGS

Data is read by the computer while drilling is in progress, using the on-line Drill program and is stored on the tape at 10,1, or 0.2m intervals. This data is then available at a later date for use in other programs (for example,KICK,SURGE,COST,OPTBIT and HYDRL).

The data can also be accessed by the REPORT program,which allows the operator to list both raw and calculated data in various formats.Either detailed data or data averaged over any particular depth interval, may be listed.

In addition, the data may be plotted in various formats,at any scale the operator desires.

The following data lists have been made for this well :

- a. Bit record & Bit initialization data
- b. Hydraulic analyses
- c. Data list A
- d. Data list B
- e. Data list C
- f. Data list D

COMPUTER PLOTS

Using the REPORT program,the following plots have been drawn for this well :

GEOPLOT - 1:5000 SCALE - 2m average

Since all the data is stored on tape,further data lists or plots are available at any time on request.

HYDRAULIC ANALYSIS

Data listed from data tape every 100m for each bit run.

DEPTH. Metres

FLOW RATE. Rate of mud flow into the well,
in gallons per minute

ANNULAR VOLUMES. . . . Barrels, Barrels/Metre

ANNULAR VELOCITIES . . . Metres/min.

CRITICAL VELOCITIES. . . The annular velocity above which
the flow becomes turbulent

SLIP VELOCITY. . . . The rate of slip of cuttings in the
annulus under laminar flow

ASCEND VELOCITY. . . . The rate of ascent of cuttings in the
annulus under laminar flow

PRESSURE UNITS . . . Pounds per square inch

HHP. Hydraulic horsepower at the bit

IMPACT FORCE The impact force at the bit,
in foot pound per second squared

JET VELOCITY The velocity of mud through the bit
nozzles, in metres per second

DENSITY UNITS. . . . Pounds per gallon

COMPUTER DATA LISTING : LIST A

INTERVAL All depth records (data not averaged)

DEPTH. Well depth,in metres

ROP. Rate of penetration,in metres/hour

WOE. Weight on bit,in thousands of pounds

RPM. Rotary speed,in revolutions per minute

MW Mud weight in,in pounds per gallon

"dc" Calculated "d" exponent,corrected
for variations in mud weight in,
using a correction factor of 10 ppg

HOURS. Cumulative bit hours.The number of
hours that the bit has actually been
"on bottom",recorded in decimal hours

TURNS. Cumulative bit turns.The number of turns
made by the bit,while actually "on bottom"

ICOST. Incremental cost per metre,calculated from
the rate of penetration,in A dollars

CCOST. Cumulative cost per metre,calculated from
the drilling time,in A dollars

PP Pore pressure gradient,in equivalent
pounds per gallon.The pressure exerted
by the fluid in the pore spaces of the formation

FG Fracture gradient,in equivalent pounds per
gallon.The pressure required to fracture
the formation,calculated by the DRILL
program using Eaton's equation

It is dependant on the pore pressure,the
overburden gradient and the matrix stress.
This value may be modified by leak-off
information

COMPUTER DATA LISTING : LIST E

INTERVAL 10 m average

DEPTH. Well depth, in metres

ROP. Rate of penetration, in metres per hour

BIT RUN. Depth interval drilled by the bit, in metres

HOURS. Cumulative bit hours. The number of hours
that the bit has actually been "on bottom",
recorded in decimal hours

TURNS. Cumulative bit turns. The number of turns
made by the bit, while actually "on bottom"

TOTAL COST Cumulative bit cost, in A dollars

ICOST. Incremental cost per metre, calculated
from the drilling time, in A dollars

CCOST. Cumulative cost per metre, calculated
from the drilling time, in A dollars

IC ICOST minus CCOST, expressed as a positive
or negative sign. When the bit becomes worn,
this should change from negative to positive

COMPUTER DATA LISTING : LIST C

INTERVAL 10 m average

DEPTH. Well depth, in metres

FLOW RATE Mud flow into the well,
in gallons per minute

PSP Pump pressure, in pounds
per square inch

PBIT Bit pressure drop,
in pounds per square inch

% PSP Percentage of surface pressure
dropped at the bit

HHP Bit hydraulic horsepower

HHP/SQ IN Bit hydraulic horsepower per
square inch of bit diameter

IMPACT FORCE Bit impact force, in foot
pound per second squared

JET VELOCITY Mud velocity through the bit
nozzles, in metres per second

COMPUTER DATA LISTING : LIST D

INTERVAL 10 m average

DEPTH Well depth, in metres

SPM1 Stroke rate per minute,
for pump No 1

SPM2 Stroke rate per minute,
for pump No 2

FLOW RATE Mud flow rate into the well,
in gallons per minute

ANNULAR VELOCITIES : (in metres per minute)

DC/OH - Between drill collars and the open hole

DC/CSG - Between drill collars and casing

HW/OH - Between heavyweight drill pipe and the open hole

HW/CSG - Between heavyweight drill pipe and casing

DP/OH - Between drill pipe and open hole

DP/CSG - Between drill pipe and casing

DP/RIS - Between drill pipe and riser

PE603367

This is an enclosure indicator page.
The enclosure PE603367 is enclosed within the
container PE906018 at this location in this
document.

The enclosure PE603367 has the following characteristics:

ITEM_BARCODE = PE603367
CONTAINER_BARCODE = PE906018
NAME = Drill Data Plot
BASIN = GIPPSLAND
PERMIT = VIC/L4
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Kahawai 1 Drill Data Plot. Enclosure
from attachment 1 of WCR volume 2.

PE603368

This is an enclosure indicator page.
The enclosure PE603368 is enclosed within the
container PE906018 at this location in this
document.

The enclosure PE603368 has the following characteristics:

ITEM_BARCODE = PE603368
CONTAINER_BARCODE = PE906018
NAME = Temperature Plot
BASIN = GIPPSLAND
PERMIT = VIC/L4
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Kahawai 1 Temperature Plot. Enclosure
from attachment 1 of WCR volume 2.

PE603369

This is an enclosure indicator page.
The enclosure PE603369 is enclosed within the
container PE906018 at this location in this
document.

The enclosure PE603369 has the following characteristics:

ITEM_BARCODE = PE603369
CONTAINER_BARCODE = PE906018
NAME = Pressure Plot
BASIN = GIPPSLAND
PERMIT = VIC/L4
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Kahawai 1 Pressure Plot. Enclosure from
attachment 1 of WCR volume 2.

PE603370

This is an enclosure indicator page.
The enclosure PE603370 is enclosed within the
container PE906018 at this location in this
document.

The enclosure PE603370 has the following characteristics:

ITEM_BARCODE = PE603370
CONTAINER_BARCODE = PE906018
NAME = Geo-Plot
BASIN = GIPPSLAND
PERMIT = VIC/L4
TYPE = WELL
SUBTYPE = WELL_LOG
DESCRIPTION = Kahawai 1 Geo-Plot. Enclosure from
attachment 1 of WCR volume 2.
REMARKS =

PE603371

This is an enclosure indicator page.
The enclosure PE603371 is enclosed within the
container PE906018 at this location in this
document.

The enclosure PE603371 has the following characteristics:

ITEM_BARCODE = PE603371
CONTAINER_BARCODE = PE906018
NAME = Grapholog
BASIN = GIPPSLAND
PERMIT = VIC/L4
TYPE = WELL
SUBTYPE = MUD_LOG
DESCRIPTION = Kahawai 1 Grapholog. Enclosure from
attachment 1 of WCR volume 2.
