Palaeontology Report No. 1980/4

24

**OIL and GAS DIVISION**

INTRODUCTION

Eleven ditch cutting samples, at 100 foot intervals were investigated between 1490 feet and 2100 feet from the ALBATROSS # 1, oil exploration well. No conventional core or sidewall core material was available. The ditch cutting samples were not particularly useful regarding biostratigraphic or environmental analyses. The foram species found are listed in the distribution chart accompanying this report as page 2.

BIOSTRATIGRAPHY

For the highest sample at 1490 feet the association of *Praeorbulina glomerosa* and the earlier morphotype of *Globigerinoides bisphericus* indicates a horizon no younger than Zone F (= top early Miocene).

The interval between 1490 feet and 2090 feet cannot be accurately biostratigraphically divided because of down-hole contamination and apparently represents the early Miocene Zones F to H-1.

The dominance of *Globigerina spp.* and presence of *Globoquadrina dehiscens* (S.L.) suggests that the planktonic faunas at 2230 feet and 2270 feet represent Zone H-2 at the top of the Oligocene.

Absence of planktonic fauna at 2310 feet makes biostratigraphic designation impossible, but this lack of planktonics together with the benthonic association suggests the "Greensand" horizon.

The sequence was a shallow water one throughout, with depositional depths never exceeding 55 metres.

3/4

COMMENTS: The age estimates are tentative due to contamination  
 and poor preservation.

CONFIDENCE RATING: 0: SWC or Core - Complete assemblage (very high confidence).  
 1: SWC or Core - Almost complete assemblage (high confidence).  
 2: SWC or Core - Close to zone change but aide to interpret (low confidence).  
 3: Cuttings - Complete assemblage (low confidence).  
 4: Cuttings - Incomplete assemblage, next to uninterpretable or SWC with depth suspicion (very low confidence).

NOTE: If an entry is given a 3 or 4 confidence rating, an alternative depth with a better confidence rating should be entered, if possible. If a sample cannot be assigned to one particular zone, then no entry should be made, unless a range of zones is given where the highest possible limit will appear in one zone and the lowest possible limit in another.
