Figure 5: SWC 8, 3340m, 2mm, CL

A typical heterogeneous field with broken and better-preserved areas. Note carbonate on right and an uncommonly fresh, polysynthetically twinned plagioclase grain at centre.

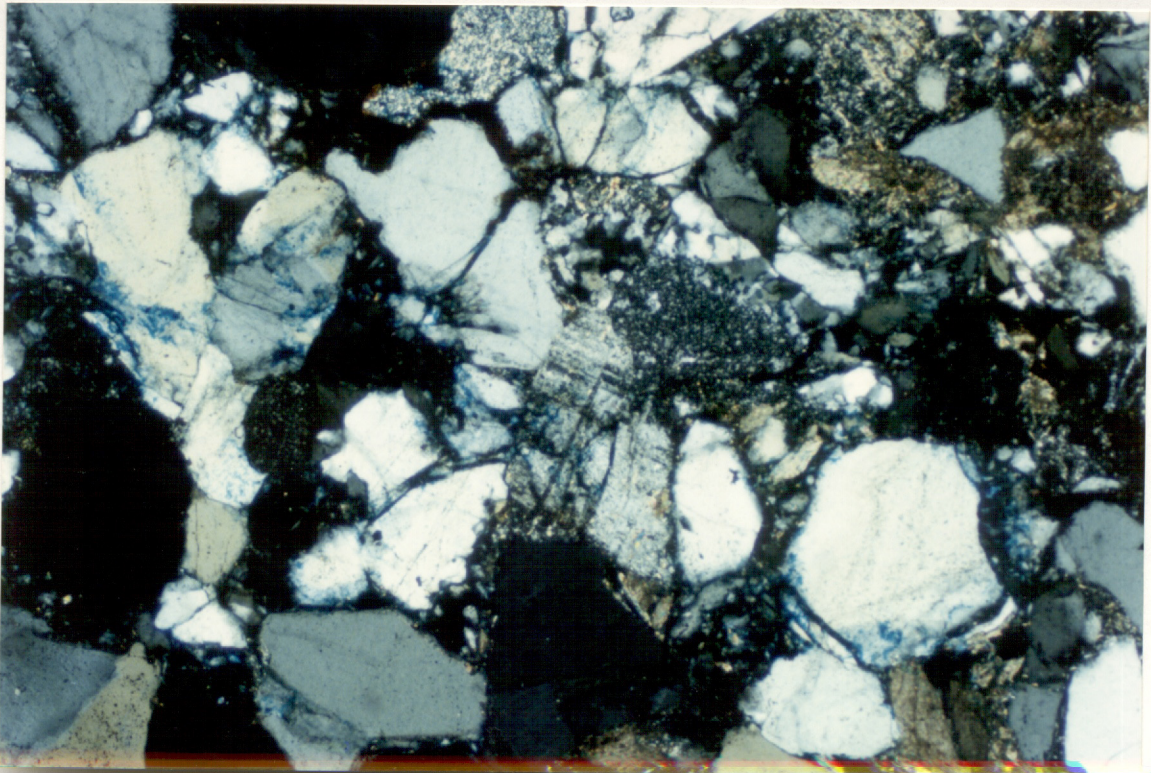

Figure 6: SWC 8, 5340m, 2mm, CL

Most feldspar in these rocks is like the grain at the centre of this field; peppered with small crystals of alteration products and barely (if at all) showing twinning.
