## VELOCITY SURVEY, FERGUSON HILL NO. 1

A velocity survey was conducted at Ferguson Hill No. 1 on 4 May, 1964. No operational difficulties were encountered during the survey which was completed in seven hours.

The Survey Plat ( page 5 ) included with this report indicates the relationship between the shot holes and the well. Locations ' $B$ ' and ${ }^{\prime} C$ ' were shot for geophone depth positions of 4000 ft . and shallower. All deeper positions were shot from the far holes. All depths were shot from both sides of the well. Average corrected times were used in computing interval and average velocities.

Good breaks were obtained at all depths with the exception of the deepest position, $11,500 \mathrm{ft}$. It was found that Shot Location ' $D$ ' required heavier explosive charges than ' $A$ ' Location. Uphole times and the times obtained from the reference geophone indicate a much thicker weathering layer at Location ' $D$ '. Most charges at 'D' were apparently in weathering which would account for the energy loss.

Curves plotted and submitted ( page 6 ) with this report indicate a gradual increase in both average and interval velocity with depth down to $10,000 \mathrm{ft}$. A decrease is noted in interval velocity between the $10,000 \mathrm{ft}$. level and the deepest shot at $11,500 \mathrm{ft}$.

A deep well geophone supplied by United Geophysical Corp. was used for this survey. This geophone is a pressure sensitive type.

Respectfully submitted,

Warrnambool, Victoria
11 May, 1964
