1 INTRODUCTION

This report covers the acquisition of Phase 2 of the Summer Hill Gravity Survey conducted between October 26 and November 1, 2002. Phase 2, located within PEL 57 (South Australia) and PEP 151 (Victoria) consisted of some 237 gravity stations including 196 new locations as well as both repeat and base station observations (**Figure 1**).

Due to delays with the granting of Exploration Licence PEP 151 to Essential Petroleum Resources (Operator), Phase 2 of the Summer Hill Gravity Survey was recorded much later than Phase 1 which was conducted in May 2002 within PEL 57. Acquisition for the South Australian portion of the survey is described in the separate Origin Energy report "2002 Summer Hill Gravity Survey Final Report, Part A : Acquisition".

Haines Surveys of Aldgate, SA, conducted the Phase 2 survey using a Scintrex CG3 Autograv instrument. Permitting was handled by Chris Annear of Petroleum Support Services based in Mt Gambier.

2 SURVEY OBJECTIVES

The Summer Hill Gravity Survey was designed to provide high resolution gravity information over a Waarre Sandstone play located in the southern part of PEL 57 (South Australia) with possible extension into the western portion of PEP 151 (Victoria).

Previously recorded seismic data identified a potentially significant structure at the Waarre Sandstone level. Regional gravity data highlights the Summer Hill Lead as a significant gravity anomaly, and this survey was aimed to provide confirmation of structural closure and to identify the approximate location of the crest of the structure.

3 SURVEY LOCATION

The survey grid straddles the South Australian-Victorian border and is located approximately 27 km southeast of Mt Gambier (**Figure 1**). The coastline provided the southern limit to the survey. A small portion of the grid extended into the Lower Glenelg National Park.

4 FIELD OPERATIONS

4.1 Environment

The PIRSA Statement of Environmental Objectives and Assessment Criteria for Pipeline Preliminary Survey Activities was adopted for the Summer Hill Gravity Survey (PIRSA, 2001). The objectives were relevant to and adequately covered the survey activities. The same conditions were applied to the Victorian survey extension.

The survey had an extremely low impact and required no line clearing or fence alteration. A 4WD utility and quad bike were used for most of the survey. The option of a backpack for difficult areas was always available. There were no known animal diseases or quarantined properties in the area of the survey grid.

Permission to enter the Lower Glenelg National Park for the Phase 2 programme was granted by the Victorian Department of Natural Resources and Environment on the condition that readings were taken on nominated tracks.

A Goal Attainment Scaling Inventory is included in Table 1 rating environmental impacts relevant to the Summer Hill Gravity Survey.

4.2 Permitting

The permitting process was completed in excess of 21 days prior to the start of fieldwork. All landowners were supplied with documentation describing the field procedures. Special requirements for each property were noted and at the end of the survey the landowners were contacted again to make sure that everything was in order. Nineteen landowners were involved and there were no restoration claims.

A full account of permitting conducted for the project is provided in **Appendix 2**.

4.3 Data Acquisition

In the past gravity surveys had been conducted along seismic lines at the same time as seismic surveying. This was the first pure gravity survey in the area and acquisition techniques were based on mining experience as well as the Phase 1 Summer Hill gravity acquisition completed in May 2002 in South Australia. A Landcruiser manned with two people was used for most of the survey, with the quad bike or backpack being used in the difficult or soft areas.

Survey control was provided using the Real Time Kinematic GPS technique with a base station centrally located at Summer Hill. A Scintrex CG3 Autograv was used for gravity observations. The main area of the grid had a station spacing of 250 metres with stations on the perimeter extending to 500 metres.

Appendix 1 provides a full account of acquisition activities for the Summer Hill Gravity Survey.

5 CONCLUSIONS

The operation proved successful with good quality gravity data being acquired. The permit man and gravity operators worked well together, both being recommended for future surveys.

The permit man played a key role in the success of the survey utilising his local knowledge and communication with landowners to allow the Haines personnel to concentrate on data acquisition. He also ensured that all environmental and safety regulations were adhered to.

There were no environmental or safety incidents.

Introduction

A detail GPS gravity survey designated as Summer Hill Victoria Gravity Survey was carried out in an area approximately 1 kilometre west of Nelson in Victoria. The survey was conducted over 7 days from 26 October to 1 November 2002 on behalf of Origin Energy Resources Ltd.

The proposed gravity survey consisted of 116 stations in a grid of 12 N-S lines with intermittent line spacings of 250m and 500m, and intermittent station spacings of 200m and 500m. Lines were orientated north-south. The proposed gravity survey was coincident with AMG and bounded by the following Zone 54 coordinates: in the south-west 496000E 5787000N, north-west 496000E 5793000N, north-east 501000E 5793000N and south-east 501000E 5787000N.

The completed gravity survey comprised a total of 196 gravity stations in a grid of 17 N-S lines coincident with AMG Zone 54 coordinates. There were 12 observations repeated for quality control purposes including a number used to verify gravity features. Four repeats were compared with observations from a previous survey (Summer Hills Gravity Survey completed May 2002) and 8 repeats compared with observations from the Summer Hills gravity survey, giving a repeat percentage of 6.15%.

The Bouguer anomaly processing has been performed using a country rock density of 2.67 g/cc.

Figure 1 below shows the location of the survey area.

Figure 1. Location Diagram

GPS Observations and Processing

Carrier phase GPS data has been collected using *Trimble 4000* series Geodetic receivers.

Measurements to existing control have been made using Static techniques with baselines processed to double difference fixed solutions resulting in horizontal and vertical precision of approximately 2 cm.

Measurements for detail gravity observations have been made using Real Time Kinematic (RTK) techniques giving horizontal and vertical precisions of at least 5 cm.

Static processing has been done using Trimble GPSurvey Version 2.35 software and RTK processing using Trimble TDC1 firmware and TRIMMAP Version 6.0 software.

The GPS horizontal coordinates (WGS84 datum) have been transformed to and from AGD coordinates using the ICSM published 7 parameters for WGS84 to AGD84. The AGD Latitude and Longitude is then converted into AMG Zone 54 grid coordinates.

The GPS ellipsoidal heights (WGS84 datum) have been corrected to orthometric heights (AHD) using the AusGeoid98 geoid model for the control and the gravity stations.

Details of Horizontal and Vertical control are given in the sections below.

Gravity Observations

Gravity measurements have been made using *Scintrex CG3 Autograv* instruments. The instrument number 408276 was used in this project.

Readings of 120 seconds were taken at base station. Readings of 40 seconds were taken at all other gravity survey points.

Base station readings were taken at the beginning of the day and at the end of the day's fieldwork.

The CG3 instrument applies an instrument drift correction to its final gravity reading. Any residual drifts between base station readings are corrected by the gravity post processing software. The instrument also applies Earth Tide Correction to its final gravity reading at each station. The instrument calibration constants are contained in the daily gravity data files.

Survey Control

A local gravity/GPS base was previously established in the Summer Hill survey area (Summer Hill Gravity Survey completed May 2002) and designated 00000001. The base is marked with a cut metal star picket at the natural surface with an adjacent witness post (steel star picket) with a metal tag attached and stamped Haines Surveys GPS & Grav Base 00000001.

Horizontal and vertical control for Base 70211331, was supplied by the Lands Department of South Australia

Gravity control was established to 70211331 by repeated loop observations opening and closing on 00000001. The base value for 00000001 was previously established in the Summer Hills survey area (Summer Hills Gravity Survey completed May 2002).

Control information (**WGS84 heights have been derived using AusGeoid98**):

SUMMER HILLS SURVEY/GRAVITY CONTROL

Station	WGS84			AMG84 Zone 53		AHD	Isogal84
	Latitude	Longitude	Height	Easting	Northing	Height	Gravity mgal
70211331	-38° 02' 49.31353"	140° 57' 54.48040"	32.763	496818.949	5788789.59	36.508	979999.869
00000001							979994.227

Point Numbering and Marking

An 8 digit point number is used to identify each gravity station. The first 4 digits indicate the line number. The second 4 digits indicate the station number

The grid lines are in a N-S orientation and the 8 digits are constructed, from the coordinates, for each gravity station using

Line No = (AMG N - 5700000) / 10 Stn No = (AMG E - 400000) / 10

eg. Planned local gravity station coordinates

5789000N 496750E

Line No = 8900

Station No = 9675

i.e. Pt No = 89009675

Station numbers have not been expanded in the processed data.

The gravity stations have not been marked in the field.

Gravity Processing

The gravity values for this survey are related to the *Australian Gravity Base Station Network* using the *Isogal84 (IGSN 71)* values at known Gravity Stations as provided by DMR.

Note that all gravity values shown in these surveys are expressed in units of milligals.

The field gravity observations have been processed using standard formulae and constants to produce a Bouguer Anomaly for each gravity station.

The meter reading as recorded in the raw Scintrex data file is corrected for instrument tilts, meter drift and Earth Tide. Post processing corrections are detailed below.

Drift

The residual drift between base station readings is calculated for each station reading proportionately by time. This is the drift value shown in the processing output.

$$\text{Drift} = [(t_1 - t_n) ((b_2 - b_1) / (t_2 - t_1))]$$

- t_n = time of meter reading at each station
- b_1 = base meter reading prior to station reading
- t_1 = time of base reading b_1
- b_2 = base meter reading after station reading
- t_2 = time of base reading b_2

Obs mgal

This is the observed gravity value in milligals.

$$\text{Obs} = b_g + (r_n - \text{drift}) - b_1$$

- b_g = base stn gravity value (Isogal84)
- r_n = meter reading at each station as shown in the CG3 .dat file
- drift = residual drift correction as shown above
- b_1 = base meter reading prior to station reading

Anom

This is the difference between the observed gravity and the theoretical gravity value at each station. The theoretical value is calculated using the *1967 International Gravity Formula*.

$$\text{Anom} = \text{Obs} - g_{th}$$

Obs = observed gravity as explained above

$$g_{th} = 978031.8 (1 + 0.0053024 \sin^2\phi - 0.0000059 \sin^2 2\phi)$$

ϕ = WGS84 Latitude

Freeair corrn

The freeair correction is calculated using

$$\text{Freeair corrn} = 0.3086 H$$

H = height above sea level (AHD height)

Bouguer corrn

$$\text{Bouguer corrn} = 0.04191 \rho H$$

ρ = density (2.67 g/cc used for this survey)

H = height above sea level (AHD height)

Bouguer Anom

$$\text{Bouguer Anom} = \text{Anom} + \text{Freeair corrn} + \text{Bouguer corrn}$$

Results Formats

Printed results of the gravity processing (with Bouguer corrections at density 2.67 g/cc) are included in the Appendix of this report. The results are also supplied in digital form on floppy disk with the following of files being supplied.

ALLCOR.XYZ ALLGEO.XYZ ALLCSV.CSV

Field gravity observation files with the extension .DAT and .DC and summarised GPS baseline solution files with extension .GPS are also supplied in a separate subdirectory named OBS.

ALLCOR.XYZ format

This is a *GEOSOF*T compatible XYZ (space delimited columns) file. The data is sorted by Day then Line and Stn number. The column order is as follows:

AMG E	AMG N	Line	Stn	drift	corr'd	obs	anom	freeair	bouguer	bouguer	height
					meter	mgal		corr	corr	anom	(AHD)
										(2.67)	

ALLGEO.XYZ format

This is a *GEOSOF*T format XYZ (space delimited columns) file. The data is sorted into Line and Stn number suitable for profiling. The column order is as follows:

Line	Stn	AMG E	AMG N	drift	corr'd	obs	anom	freeair	bouguer	bouguer	height
					meter	mgal		corr	corr	anom	(AHD)
										(2.67)	

ALLCSV.CSV Format

This is a Comma Separated Variable format file. This format facilitates data import into spreadsheet and database software. Each record (line) contains the following data fields:

Pt Number, Line No, Station No, Date, Day Number, Local Time, WGS Latitude, WGS Longitude, WGS Height, AMG East, AMG North, AHD Height, Meter reading, Meter reading standard deviation, Earth Tide Correction, drift correction, corrected meter reading, gravity difference (mgal) from base, observed gravity (mgals), gravity anomaly, freeair correction, Bouguer correction (2.67), Bouguer anomaly

***.DAT**

These are the raw data files from the *Scintrex* CG3 gravimeter. There is a separate file for each day's data and for each field party. The files are identified by the Julian day number (001 = Jan 1st) with the prefix G. eg. G142 = day 142 (21st May).

***.DC**

These are the GPS Real Time Kinematic Data Collector files. They are ASCII format files containing the GPS vectors from the base station. The data is structured in a Trimble format (DC file Version 4).

***.GPS**

These are the GPS solution summaries for all post processed Fast Static baselines with a separate file for each day's solutions. Each record (line) contains the following data fields:

Station, Solution Type, GPS Time, WGS84 Latitude, WGS84 Longitude, WGS84 Height, WGS84 dX, WGS84 dY, WGS84 dZ, Wgs84 dH, Baseline Distance, Solution Reference Variance, Solution RMSE, Rover Antenna Height, Baseline Standard Deviation , Solution Variance Ratio, Observation Count/Rejects, Observation Start time, Observation Finish time

PERMITTING CONTRACTORS REPORT

Petroleum Support Services

ORIGIN ENERGY PEL 57 SUMMERHILL 2002 GRAVITY SURVEY (PHASE 2) PERMITTING REPORT.

Permitting for the Phase 2 survey began on Monday 16-9-2002 and was completed by 9-10-2002. A total of 19 landowners/occupiers were permitted, although not all of these landowners were affected, especially those within the township area of Nelson.

Recording began on Saturday 25-10-2002 and was completed on Thursday 31-10-2002. This was despite three mid-survey changes to the programme which saw the addition of nearly 50 recording points. This alteration to programme did not cause any problems but it did mean that several properties had to be revisited to pick up the extra points.

In the planning / permitting stage a map was made to try and show the recording points on each of the properties. This was a lesson from the first stage of the survey when blanket permitting of the whole grid occurred. The map was a composite of a 1:10,000 town boundary map, a standard 1:25,000 physical / cadastral map and an approximately 1:25,000 recording station points map. Landowners who lived within 50 metres of these programmed stations were permitted to allow for any conversion discrepancies between the different scaled maps. This was a much better system than blanket permitting whole blocks of residents in Nelson.

The flexibility of access offered by the gravity surveying method allowed many offset recording points within the township. This enabled roads or footpaths to be used for recording so that technically, no private property was entered. Similarly, the numbers of small hobby farm blocks requiring entry for recording were also reduced by offsetting points from one side of a boundary fence to the other. Given that there was no modification to fences, an offset recording could save 15-20 minutes of detour time.

Information obtained from the District Animal Health Vet at Hamilton confirmed that there were no known animal diseases or quarantined properties within the survey area.

There were no major concerns from the landowners excepting on one property where a crop of Canola was growing and was at a critical stage of growth. Damage to the crop would be permanent if driven over by the heavy tyres of the ute so the landowner asked that the quad bike be used. One landowner had a specific day that he requested we not work on his place to avoid interfering with his sorting out and movement of cattle prior to sending them off to sale. The flexibility of the Gravity acquisition method enabled this to occur.

Apart from the initial teething problems to be expected at the start of each new job, the acquisition went very smoothly. To minimise any delays due to field operators waiting on necessary equipment, Haines Surveys was sent copies of the following as they were made available.

- Potential Hazards (Attachment 2)

- VicRoads letter (**Attachment 5**)

It was pleasing that these comments / recommendations were noted and acted upon as the field operators arrived fully equipped and ready to start.

To start the programme an induction and safety meeting was held with the two field operators. Specific landowner requirements and operational procedures were discussed and each person was provided with a folder containing :

- ◆ Landowner names contacts and specific requests (**Attachment 1**)
- ◆ Potential hazards (**Attachment 2**)
- ◆ Detailed property boundary maps (**Attachment 3**)
- ◆ A dot map of the survey points on a 1: 25,000 physical overlay (**Attachment 4**)
- ◆ Copy of the letter from VicRoads (**Attachment 5**)

One of the people who had been part of the previous survey was again present on this survey. This had some implications for the speed of recording because he understood the layout of the area and best procedures to ensure efficient data recordings.

The quad bike was used only when necessary as the previous survey had shown it was a much slower vehicle to use when recording. At the suggestion of the landowners near the Glenelg River estuary the bike was used in these particularly wet low lying areas. Similarly, it was used within the Canola crop paddocks to avoid permanent damage to the growing crop.

Recording within the Lower Glenelg National Park was programmed to occur on existing fire and Park Management tracks. Recording was able to occur within the Park due to some commendable action by DENR personnel. Firstly, Ranger Bruce Mackereth who understood the low impact nature of the gravity survey method and was capable of making an immediate decision allowing the recording to proceed. Also Environmental Research Co-ordinator Michelle McHugh could comprehend the process and was able to co-ordinate and fast track the necessary paperwork to enable the readings to occur within the Park. The data from the Park was essential to complete the background data of the northern section of the survey grid.

The Summerhill Gravity Survey was completed successfully. There were no complaints from landowners or affected parties and recording was achieved smoothly and efficiently.

PHOTO 1. A standard 4WD utility and trailer were the only plant required to carry all the necessary equipment.

PHOTO 2. The Quad Bike fully set up. Infield communications with the quad bike operator were a problem sometimes. Radio transmissions were difficult to pick up through the crash helmet and over the bike engine and motion noises. As the bike was used infrequently this did not become a major problem. Change of vehicle and equipment took about 30 minutes to setup.

PHOTO 3. The Gravity metre has to sit on an independent tripod with levelling adjustment. Hand pressure is all that is required for this levelling to occur. Photo taken on track inside Lower Glenelg National Park.

PHOTO 4. Exactly the same photo monitoring point as for Photo 3. As can be seen, the " footprint " of this tripod is virtually nil.

PHOTO 5. The Gravity metre set up on the tripod and ready to be programmed.

PHOTO 6. The touchpad adjustments made reprogramming for each record point rapid and simple.

PHOTO 7. Waiting for the metre to take its recording. In open country this usually only took about one minute to register the point. In forested areas or where the tree canopy was thicker the waiting time could increase up to 10 minutes. Surveying without the standard tie in to the base station could alter this timeframe.

PHOTO 8. The " Base Station ". This was set up on top of Mt Ruskin close to the South Australian / Victorian Border. Providing that there are no transmitting problems, the base station is visited each morning and night.

GENERAL NOTES ON HAZARDS & PROCEDURES FOR GRAVITY SURVEY					CONSERVATION PARKS	RIVERS
DAIRY FARMS	SHEEP FARMS	BEEF FARMS	HOBBIY FARMS			
Centre Pivots have deep Wheeltruts. Wet peaty country has numerous drainage channels and many frogs therefore many snakes, especially Tiger Snakes. Bulls can be dangerous, Jersey bulls are notoriously bad tempered.	Not at this time of year	Seperation of any cow from its herd can cause irrational / dangerous behaviour from that animal	Dogs, cats, ducks, geese, chooks etc. Dense bushland, fallen timber, vegetable plots. B & B guests.		Snakes, Yellow Bellied Parrot, Cliffs, especially near the river	Steep cliffs, dangerous edges. Boggy areas in Estuary. Many snakes in estuary and spring country. Waders suggested as protection against possible snakebite if too boggy for vehicle access.

Your Ref:

Dear Chris,

**RE : PROPOSED GRAVITY SURVEY
NELSON - MT GAMBIER ROAD**

I refer to your letter dated 5 May 2002, concerning the above matter.
VicRoads does not object to the proposed activities subject to the following conditions :-

- i) The Glenelg Shire has been informed and has no concerns regarding the work.
- ii) Signage and traffic control is to the satisfaction of VicRoads Regional Manager South Western Victoria.

It is noted that the activities should involve minimal disturbance or damage to the land and vegetation. This being the case, the proposed activities may proceed unless upon further inspection of preparations by VicRoads, it is considered that the proposed activities constitute an unacceptable risk to traffic safety.

VicRoads accepts the consent and notice form provided, as notice to enable land access and activities required for the survey to proceed. VicRoads conditions appear on the consent and notice form enclosed.

Please contact Mr Peter Hill (ph 55619215), should you wish to discuss this matter further.

Yours sincerely,

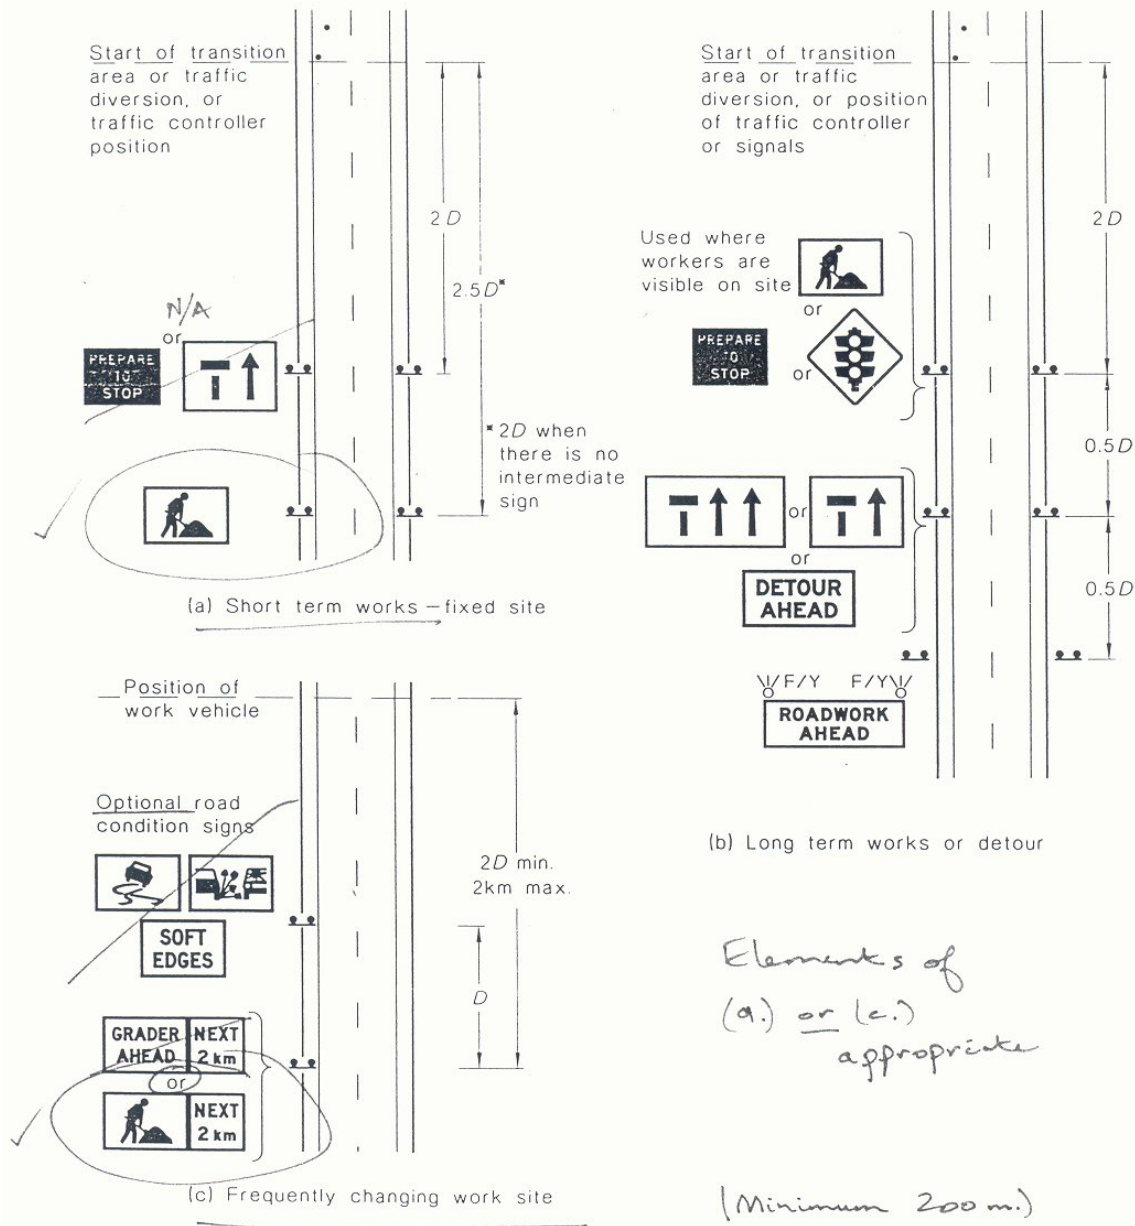

for **GRAHAM CLARKE**
MANAGER PROGRAM DEVELOPMENT
SOUTH WESTERN REGION

O:\AM08515\ph020735.doc

- (iii) *Mobile works* All advance signs for mobile works are carried on vehicles (see Clause 4.7).
- (iv) *Temporary or portable traffic signals* Long distance warning of the existence of unexpected traffic signals, e.g. on rural roads, may be required. The sign assembly Signals Ahead (W3-3) and 1 km (W8-5) should be used.

D = speed in kilometres per hour or the approach speed of traffic if significantly different from the speed limit

(Minimum 200 m.)

Advance warning recommended
ch speed of traffic Rural
Situation

Chris,
